FOREWORD

Minor Irrigation Schemes have a major role in the Agricultural development in the country. These schemes, have a short gestation period, require limited investment, and provide benefits within a short time to millions of farmers in the country. Minor Irrigation accounts for major share of the irrigation potential utilized in the country. These schemes are crucial especially in the un-even terrain, hilly areas and result in improved water use efficiency.

Considering the critical importance of Minor Irrigation to agricultural growth, and need to manage our ground water resources in a sustainable manner, periodical review of number, distribution and status of Minor Irrigation Schemes is required for policy and planning purposes. **Census of Minor Irrigation Schemes (MI Census)** is being conducted once in 5 years throughout the country under the central scheme "Rationalization of Minor Irrigation Statistics (RMIS)". The three MI Censuses conducted so far with reference years 1986-87, 1993-94, and 2000-01 – have provided extremely useful information. The present report is for the 4th MI Census conducted with reference year 2006-07. This census was conducted in 28 States and 5 UTs except Daman and Diu and Lakshadweep.

MI Census is a large exercise involving State, District and Village level functionaries of the State/UT Governments for collection of data relating to various aspects of Minor Irrigation. The overall supervision of the conduct of MI Census was done by the Minor Irrigation (Statistics) Wing of this Ministry. The data processing has been done under the overall guidance of the unit of National Informatics Centre in Ministry of Water Resources, River Development and Ganga Rejuvenation after detailed checks and scrutiny at each level.

I am sure that the publication would be useful for policy makers, researchers, planners, agricultural scientists, professionals and all others concerned with water resource management and its development.

PROLOGUE

Water management is of crucial importance for sustained development of Agriculture. More and more emphasis is being laid on optimum utilization of available water resources. Within the sector, Minor Irrigation schemes benefit a large number of farmers in the country in helping them to meet their irrigation requirements. More and more ground water schemes are coming up under private ownership resulting in consistent growth in agricultural production over the years. The share of private sector in Minor Irrigation schemes has shown increasing trend over the years.

The technological developments, the extent of rain fall each year, the under-ground water level, the water flow patterns in the rivers and the increasing pressure on the availability of water make a periodical review of number, distribution and status of Minor Irrigation schemes imperative for appropriate planning and decision making. Census of Minor Irrigation schemes is being conducted once in five years throughout the country to provide detailed data about the MI schemes under central scheme "Rationalization of Minor Irrigation Statistics (RMIS)". The Census of Minor Irrigation (MI) schemes provides detailed information upto village/ block levels on number and type of MI schemes in use, 'not in use' with reasons thereof, their created potential, extent of utilization, cost of construction of schemes, their financing, share of public sector and that of individual farmers in MI schemes, as well as loss of potential due to under-utilization, etc. The distribution of MI schemes across tribal and other regions, among social classes of farmers, by size of holding, and by season and crops are also provided in the report.

I would like to place on record our sincere thanks to International Water Management Institute, Anand, especially Prof. Tushar Shah and his team for helping us with the analysis and refining the report.

This report, for the 4th MI Census with reference year 2006-07, provides very useful information and I hope it will be of immense use to the Planners, Administrators and Scientists in the field of agriculture and other policy formulation activities.

(Dr.Amarjit Singh)

CONSERVE WATER - SAVE LIFE

PREFACE

Minor Irrigation schemes play a major role in meeting the irrigation requirement for agricultural production in the country. The Minor Irrigation (MI) schemes have the Culturable Command Area (CCA) of less than 2000 ha and are implemented in the States by different departments including Agriculture, Irrigation/Water Resources, Rural Development, Land Administration, Public Works Department etc. A number of departments are involved in implementing programmes for growth and development of Minor Irrigation at the Central level also. Under the Ministry of Rural Development, Department of Land Resources has 'Integrated Watershed Management Programme (IWMP) after merging Integrated Wastelands Development Programme, Drought Prone Areas Programme, Desert Development Programme which, inter-alia, helps development of Minor Irrigation Projects in the States. Under Mahatma Gandhi National Rural Employment Guarantee Act (MNREGA) funds are provided for the development of surface water schemes, reclamation, renovation of ponds, lakes etc. Ministry of Agriculture has also been providing financial support to farmers for the development of Minor Irrigation through Commercial Banks, Regional Rural Banks, Co-operative Banks and National Bank for Agriculture and Rural Development (NABARD).

Due to changes in technology from manual and animal-based equipments to mechanized equipments and with availability of advance water distribution devices like fiber/polythene based pipes, drip and sprinkler irrigation systems, there has been a shift in the share of different types of Minor Irrigation schemes. The ground water availability has also undergone significant change in many States. To have a clear picture of the distribution and use of different types of minor irrigation schemes, it is necessary to obtain detailed information on the existence, working condition, cost of construction and operation and other issues related to functioning of minor irrigation schemes through a Census of Minor Irrigation schemes. Minor Irrigation Census is also necessary to study the changes in the utilization pattern of these schemes due to changes over time such as less discharge of water, drying up of storage, water level going down, and intrusion by sea-water or industrial effluents etc. Under the Central Sector Scheme component- "Rationalization of Minor Irrigation Statistics (RMIS)", the Minor Irrigation (Stat.) Wing of Ministry of Water Resources, River Development & Ganga Rejuvenation conducted the 4th Minor Irrigation Census. The States are fully involved in the collection of data and Statistical Cells have been established in the States and UTs to monitor the information relating to progress of irrigation through MI schemes.

The 4th Minor Irrigation census was conducted with reference year 2006-07 in 28 states and 5 UTs except Daman & Diu and Lakshadweep. The Census work was conducted under the overall charge of the Head of Nodal Department, designated as Minor Irrigation Census Commissioner. The field work was completed at the village level by Village level workers / Patwaries, Village Accountants etc.. The field work at the village level was supervised by Block Development Officers (BDO)/ Tehsildars and the same was monitored and reviewed by District level officers. Detailed training was provided to explain concepts, definitions and instructions to fill the schedules at a series of training workshops organized at All India level followed by State level and ultimately, at district level for primary enumerators. The report provides results at

the State and all India level by way of integrated tables supported by various statistical graphs and charts. State-wise census data by specific types of schemes, viz. dug-wells, shallow and deep tube-wells, surface flow and lift schemes along with specific features have also been presented. District-wise tables on the various aspects for each type of MI structure are available on the Ministry's website (<http://mowr.gov.in>) for wide circulation and utilization.

In preparation of this report and finalization of results, valuable guidance and encouragement was provided by the then Secretary Shri D. V. Singh, Ministry of Water Resources and Special Secretary, Sh. G. Mohan Kumar at different stages for carrying out the census work. Shri Anuj Kumar Bishnoi, Secretary, Ministry of Water Resources, River Development and Ganga Rejuvenation and Dr. Amarjit Singh, Additional Secretary have been a source of continuous inspiration and provided valuable comments and guidance in bringing out this report in its present form. I express my sincere thanks and deep gratitude to them. The Minor Irrigation Census Commissioners in the States /UTs put in lot of efforts in completing the field work with dedication and focus. In the different stages of 4th MI census, guidance of Sh. V.K. Arora, ex ADG (Stat.) is gratefully acknowledged. The contributions of Shri A.K. Srivastava, Ex-Director (Stat.) at the planning stage is also duly acknowledged. Dr. S. P. Sharma, Director (Stat) deserves a special mention as the write up of the report, charts and graphs were painstakingly drafted and designed by him. The analysis and insight into the data with policy implications were also researched by him. The finalization of results and completion of this report has been possible with strenuous efforts made by Smt. Bindu Sreedathan, Director, Shri Alok Kumar, Deputy Director, Smt. Manju Saxena, PPS, Ms. Chandrakala, AE, Shri Gyanendra Pratap Singh, Research Officer, Shri Anil Kumar, PPS and Shri Ajay Kumar Juneja in the MI (Stat.) Wing of Ministry of Water Resources, River Development & Ganga Rejuvenation. The technical work and data processing under the guidance of Shri M. Moni, DDG, Dr. Kishore Kumar, Sr. Technical Director and Shri A.K. Gupta, Technical Director (NIC) Ministry of Water Resources, River Development & Ganga Rejuvenation are gratefully acknowledged.

I must acknowledge the contribution of Shri Shilp Verma, Consultant, IWMI – Tata Water Policy Programme under the able guidance of Prof. Tushaar Shah, Senior Fellow, International Water Management Institute (IWMI), Anand, Gujarat and their team including Ms. Neha Durga, Consultant, Mr. Gourav Mishra, Pre-Doctoral Fellow and Ms. Rumia Basu, Pre-Doctoral Fellow, in compiling, mapping and making meaningful interpretation of the data and focusing on the core issues emerging from the Census data. The GIS maps and tabular presentation of the information enhanced the quality of the report.

I hope this report would be very useful to planners, academicians, researchers and all other stakeholders in this field.

(Servesh Kumar)
Additional Director General

1. Concepts and Definitions	394
2. Copies of Schedules	405

Highlights

- **General**

- More than 2.1 crore Minor Irrigation (MI) structures were reported from 609 districts and 6,41,062 villages in the country.
- Significant growth in ground water schemes was observed from 18.5 to 19.75 million during the period from 2001-01 to 2006-07.
- Uttar Pradesh possessed the largest number of all types of MI schemes in the country (42.8 lakh), including 42.5 lakh Ground Water schemes, while, Madhya Pradesh (2.39 lakh) possessed the largest number of Surface Water schemes.
- For dug wells Maharashtra is the leading state, whereas Uttar Pradesh and Punjab are leading for tube wells (Shallow and Deep respectively), while Andhra Pradesh for surface flow and Madhya Pradesh for surface lift schemes are the leading states.
- There has been decline in the number of dug wells during the period between the 3rd census and the 4th census, while the number of shallow tube wells and deep tube wells have substantially increased. So there has been a shift from Dug-wells to tube wells.
- There has been marginal decline in surface flow schemes.
- MI schemes are pre-dominantly privately owned by individual farmers and very few (less than 5%) are owned by public institutions. However, among surface flow schemes about 60% are owned by public sector.
- About two-thirds of the owners of dug wells are marginal and small farmers, and about the same proportion are owned by SC/ST/OBC farmers. On the other hand Deep tube wells are owned more by General category farmers possessing relatively larger farms.
- The share of SC/ST farmers have increased during inter-census period in shallow tube wells. However, the share of small and marginal farmers in case of shallow Tube wells has gone down during this period while in case of Deep Tube wells the same has increased.

- **Utilisation**

- About 9% of MI schemes are located in the tribal areas. The position w.r.t. location of schemes in the tribal areas has remained almost same as during the 3rd Census.
- The Irrigation Potential Created (IPC) has increased to 70 million ha in ground water schemes from 62.4 million ha during 3rd Census. There has also been significant improvement in the Irrigation Potential Utilized (IPU) in ground water schemes and it has reached the level of 79.4%.
- In many states very high level of utilization (more than 90%) of MI schemes has been observed including Haryana, Kerala, Maharashtra, Punjab, and Uttar Pradesh. In case of utilization of surface water schemes, the performance of Himachal Pradesh, Chhattisgarh, Jammu & Kashmir and Kerala has been of the high order.
- Although the share of dug-well is large in number (about 43%) but their share in irrigation potential is only about 26%, on the other hand, the shares of Deep Tube wells and Surface Flow schemes in number are about 7% and 3% respectively, but their share in IPC are about 13% and 12% respectively because of their higher IPC per unit.
- The percentage of schemes 'in-use' is more than 91.7% in case of Shallow Tube Wells and in case of surface lift schemes, it is 93.7%.
- The highest percentage of schemes running without constraints are Surface lift and Shallow Tube wells and deepening of water level in ground water schemes and less storage in water bodies resulting in less discharge is the main cause of constraints.

- There has been improvement in water use efficiency and decline in wastage of water through use of improved water distribution devices over the year as during the 3rd census about 81% schemes used open channel which now has reduced to 'about 65%' during the 4th census.
- **Financing**
 - More than 70% of MI schemes are constructed by farmers with their own savings and about 9% by Government funding and about 13% financed by bank loan.
 - In Jharkhand, about ¾th of financing and in West Bengal about 47% and in Odisha about 28% support for construction of dug wells is provided by Government. On the other hand, own savings are the largest source of financing in most of the states and especially in Tamil Nadu (89%), Andhra Pradesh (86%), Uttar Pradesh and Madhya Pradesh (81%) and Maharashtra (78%). In case of Gujarat, there is a special situation where share of others (friends and relatives) is 62.6%.
 - With regard to Shallow tube wells in the state of Chhattisgarh and Karnataka bank provide significant share of financing. The share of Government financing is high in Haryana (73%) as well.
 - The farmers in the state of Punjab (30%) and Andhra Pradesh (about 6.5%) depend on money lenders for financing deep tube wells. As far as Government financing is concerned, the states of West Bengal (89%), Assam (87%) and Odisha (74%) provide high share.
- **Surface Water Schemes**
 - The major states which have large number of reservoirs and tanks include Andhra Pradesh (81 thousand), Maharashtra (71 thousand), Chhattisgarh (56 thousand) Madhya Pradesh (56 thousand), Tamil Nadu (39 thousand), Uttarakhand (31 thousand) and West Bengal (30 thousand)
 - The total IPC through tanks is about 58.9 lakh ha out of which 39.31 lakh ha has been utilized.
- **Schemes in Command Area**
 - Over 13% MI schemes are located in the command area of major and medium irrigation projects and 12.2% irrigation provided through MI schemes was in the command area.
 - Haryana (>65%) has the highest percentage of MI schemes inside command area particularly the tube wells followed by Punjab (>35%). In case of surface water schemes Maharashtra is the leading state where above 40% of the surface water schemes are in the command area.
- **Energy consumption**
 - The use of Renewable energy is limited to Andhra Pradesh, Maharashtra, Uttar Pradesh, and Madhya Pradesh
 - In Chhattisgarh, Odisha, Jharkhand and Rajasthan animal power is still significantly used for drawing water for irrigation from wells.

CHAPTER 1

GENERAL BACKGROUND

1.1. INTRODUCTION

India has been primarily an agricultural country since ages and early civilizations have flourished along the rivers which provide source of water for agricultural and other uses. Although share of agriculture in Gross Domestic Product of the country has been declining over the years, however in the event of shortfall in rain fall in any year it affects the economy of the various sectors and employment, income is adversely affected across the sectors. Most of the rain fall which occurs in India as a result of South-Western monsoon is restricted to 4 months in a year and because of steep terrain in many areas, a large proportion of rain fall drains out to the sea and oceans on 3 sides of the country. As such to facilitate agriculture and to provide assured moisture level for crops particularly during the winter season, which gets very little rain fall, storage of water from rain fall and ice-melt, irrigation of cultivated fields becomes imperative. Therefore, irrigation works either through construction of channels for taking surface water by gravity or by construction of wells have been prevalent in India since time immemorial. In the Southern Plateau and hills/forests where wells are not feasible, construction of tanks and reservoirs by providing embankments across drainage courses to impound rain water and ice-melt became necessary to provide irrigation during the season with little rain fall.

With high growth of population in India during the last 50 years there has been increasing demand of agricultural production to provide for the growing requirement of food, raw materials for agro-industries and growing

variety of agricultural products as demanded by increasing levels of income and consumption due to growth and diversification of Indian economy. There is a vast difference between yields of non-irrigated agriculture and irrigated cultivation. Newly developed crop varieties and agronomic practices require inputs in the form of fertilizers and pesticides which also need assured irrigation at regular intervals. Besides, due to growing population and need of industrialization, construction of roads, airports, play grounds, residential complexes and offices etc., area of cultivable land is gradually going down which necessitates higher productivity of agriculture in the available land. As such there is imperative need of assured and effective irrigation to ensure high productivity of agriculture, horticulture, floriculture, viticulture etc.

In addition to growing population and increasing pressure on land, another aspect of climatic change over the last few decades has further complicated the water availability for agriculture. Un-certainty of rain fall, its distribution across the regions and over time has increased and there has been a tendency of growing temperature and increase in the sea level. Further the frequency of occurrence of natural calamities like cyclones, earthquakes and droughts/floods has increased in the recent past. As per the latest assessment of United Nations, the above trend is likely to further increase in the future and duration of rainy season as well as the occurrence of extreme events like very heavy rain fall on a day or very scanty rain fall over weeks are likely to increase in future. This will further increase the importance of storing

of water and construction of irrigation schemes to provide assured irrigation facilities for a large country like India.

Irrigation has significantly increased in India since independence and the irrigated area through major and medium projects has grown from 22.6 mha (before Ist Plan) to 107.2 mha up to 2010. However, the proportion of net area irrigated to the total net area sown is now about 44% and remaining more than half of the cultivated land does not get any assured irrigation facilities. During the period since first Plan to XIth Plan the irrigation potential in major and medium schemes increased from 9.7 mha to 44.4 m ha (about 4 and half times), on the other hand, irrigation potential of Minor Irrigation schemes increased from 12.9 mha to 62.8 mha in the same period. While major and medium irrigation projects provide hydro-electric power in addition to water for irrigation, their capital cost of construction is very high and these projects inundate large tracts of land/forests besides displacing many people and disturbing their livelihoods. It takes very significant time in construction of major and medium irrigation projects and there are environmental issues linked to construction of such projects as well. In some cases due to heavy rains and floods in their catchment area, there may be chances of high risk of sudden floods and resultant landslides may be serious cause of worry. On the other hand, MI schemes require less time in construction, small amount of cost and there are non-significant environmental issues related to MI schemes.

While distribution of water from major and medium irrigation projects require cooperative/participatory irrigation management with the help of water users' associations or with the help of involvement of Panchayat /local bodies, still there are issues of balanced distribution of water

from the head to tail of the project command area. On the other hand, MI schemes are in the control of individual farmers or a very small group of farmers, as such accessibility to water is much more and almost assured. Further with the development of new high-yielding varieties of agriculture, horticultural crops, the frequency of irrigation required has increased many fold and the major and medium irrigation projects are not able to provide irrigation facilities with such frequencies. In these circumstances, MI schemes become almost essential for small/medium farmers who can own such schemes if there is availability of required energy. As a result, the number of MI schemes has significantly increased over the years and during 2006-07 over 2.1 crore such schemes were found existing in the country.

During the earlier phases of development of irrigation works, many public sector schemes were constructed including tube wells, tanks, and reservoirs for providing irrigation to farmers. However, wells were mostly constructed by farmers themselves mainly with their own funds. Later due to significant increase in diversity of agriculture and growing incomes of farmers, with improvement in technology and availability of electricity more and more MI schemes were constructed by individual farmers. As a result high proportion of MI schemes are owned by individual farmers and mostly financed by their own savings. But with increasing mechanization of agriculture and cost of cultivation going up, economy of farming became high risk proposition. With increasing uncertainty of weather due to climatic change in many states farmers committed suicides in large numbers. As such there is a need to provide financial support to farmers especially belonging to weaker sections in the marginal and small categories.

1.2. MINOR IRRIGATION SCHEMES

MI schemes are defined as those structures either in ground water or in surface water category having Culturable Command Area (CCA) up to 2000 ha. By Culturable Command Area, it is meant that the area which can be technologically irrigated by a scheme during a year and that much cultivable area is fit and available for cultivation. Under the ground water schemes category mainly dug wells or tube wells are covered. Most of the dug wells constructed in the past have been converted into dug-cum-bore wells with a bore constructed inside dug well and water being extracted from ground under the well by electric motor or diesel pump. The remaining dug wells in some states are still using animal based water lifting devices or other methods to lift the water from the wells. The wells may be masonry (Pucca) constructed with bricks or stones or these may be non-masonry (Kutchha). Command area of dug-cum-bore well may be 2 to 5 ha while for a dug well without a mechanical lifting device it may be 1-2 ha only. The tube wells may be categorized into 2 categories depending up on the depth of bore, capacity of motor/pump set and water discharge capacity during 24 hours. However, for simplicity this has been classified into 2 categories based on depth of bore alone as the depth of bore is most common and related variable:-

- i) Shallow tube well with depth of bore up to 70 meters and water discharge in the range of 100-200 cubic meters per day.
- ii) Deep tube wells with depth of bore more than 70 meters and water discharge of 100-200 cubic meters per hour. While shallow tube wells can run from 6-8 hrs per day depending upon the availability of power/diesel, deep tube wells can run around the clock depending upon the availability of power.

Surface Water schemes are found in the form of Surface Flow schemes and Surface Lift Schemes. Water sources are found in nature like rivers, springs, streams etc or water bodies are naturally created or constructed to store water in Ponds/ Lakes, Tanks, check dams or reservoirs. Surface Flow schemes are used to take water to the fields by gravity driven flow alone by way of pucca or kutchha diversions constructed on permanent or temporary basis. There are many forms of such constructions in the different states and their names are Kuhl in Jammu and Kashmir and Himachal Pradesh, Gul in Uttar Pradesh, Ahars and Pynes in Bihar and low khones and Dongs in the North-Eastern states. Small Tanks or reservoirs are usually owned by Panchayats or other local bodies and have command area of up to 40 Hectares. The large reservoirs with comparatively larger distribution system spread over more than one village may have command area up to 1000 or even 2000 Ha and these are normally constructed by state Government departments. These are very common in the North-Eastern States, Chhattisgarh, Maharashtra, and Gujarat. Large number of Check dams have been constructed by community participation in the state of Gujarat to conserve soil and water, increase moisture in the soil as well as store water for irrigation across the state.

Surface Lift schemes are used in the regions where water cannot be taken to the fields by force of gravity as in the plain areas and in case of water bodies lying in the low level. In these areas, where energy sources in the form of electricity or diesel are affordable and available, mechanical water lifting devices are used to lift water from water bodies to the fields through water channels constructed or through pipes and micro irrigation devices like drip and sprinklers systems. Such schemes are categorized as surface lift schemes. The details of various types of MI Schemes are provided in Annexure-I, Part 2.

1.3. MINOR IRRIGATION STATISTICS

The status of minor irrigation in India was critically examined by National Commission on Agriculture which found that many State governments publish some information on the number of principal irrigation sources viz. wells, tube wells, tanks, etc. in their agricultural statistics reports but detailed information on irrigation potential created or utilized was not available at all India level. As such a sub-committee on irrigation statistics set up by the Planning Commission in 1970 following the report of the National Commission on Agriculture recommended for conducting detailed census of minor irrigation schemes. The National Commission on Agriculture had recommended that a census of sources of minor irrigation may be undertaken along with the Agricultural Census once in five years.

The Technical Committee on Agricultural Census 1980-81 discussed the list of items in respect of data relating to minor irrigation proposed to be collected along with the agricultural census in 1980-81. It was considered that the agricultural census data are being compiled from the existing land records in various States and the information as required for minor irrigation structures do not figure in the land records, and it would not be possible to collect this information through the main agricultural census. While discussing various issues and problems in the irrigation sector in the Planning Commission in 1986, it was stressed that census of minor irrigation schemes be conducted quinquennially, i.e. once every five years to take care of growth in minor irrigation sector and changes in types, capacity, sources of energy, finance etc.

Minor irrigation programs in the States are dealt by different departments under different sectors. The progress reports relating to minor

irrigation programs received from different departments at the Centre are used for compilation of minor irrigation data for the States concerned. There has not been a single nodal department in the State to compile the minor irrigation statistics for the entire State. The structures installed by the farmers from their own efforts are generally not recorded. The irrigation potential of groundwater schemes is usually reported on the basis of certain assumed yardsticks. Usually no efforts have been made at the State level to provide a scientific basis for such yardsticks. In case of State irrigation works the irrigation potential and utilisation are usually estimated on the basis of such assumed duties/water allowances. The reported figures of irrigation potential created by certain schemes during a particular period might have been reduced over a period of time but no depreciation etc. has been taken into account in reporting the figures of cumulative irrigation potential created. The figures in respect of private minor irrigation works installed totally by the efforts of the farmers are usually not based on any specific enumeration or sample survey. However, the main source is figures indicated by States/UTs during annual plan discussions. As such later a central scheme was formulated for this purpose after rationalization of the scheme and the same was notified as Rationalisation of Minor Irrigation Statistics (RMIS). Under this scheme a nodal department is identified in each state/ Union Territory for co-ordination of statistics with all the departments dealing with construction of minor irrigation structures in the state/ UT concerned and providing information related to Minor Irrigation to the Government of India on regular basis. In this department a nodal Minor Statistics Cell was established to help in conducting MI Census and provide information on annual and quarterly basis about provision for construction of MI schemes by

different departments and their irrigation potential created and utilized along with number of such schemes constructed over time.

1.4. ALTERNATIVE SOURCES OF DATA

The main sources of minor irrigation statistical data in India are:

- (i) **Land Use Statistics (LUS)** of Ministry of Agriculture, which provide information on Gross and Net Area irrigated by season and crops. The information on area irrigated is an ancillary product from the Land Use Statistics as part of Agricultural Statistics ever year. The net area irrigated by the government canals, private canals, tanks, tube wells, other wells and other sources are compiled for village/tehsil/district and the State level. Similarly, area irrigated more than once under different crops are also compiled. The Directorate of Economics and Statistics, Ministry of Agriculture, Government of India publishes regularly the national level information with time lag of about 3 to 4 years. The primary data for LUS are collected by village patwaris in prescribed forms by plot to plot enumeration in certain States and are estimated on the basis of sample surveys in other States. The basic enumeration forms are different in the States and the instructions for obtaining details of area under irrigation and its sources are inadequate. In some States, no separate columns for the sources of irrigation have been provided in the prescribed Khasra registers. Classification of sources of irrigation does not provide data on irrigated area by important sources like shallow tube

wells, dug wells, dug-cum-bore wells, deep tube wells, diversion schemes and surface lift irrigation schemes. The gross irrigated areas according to different sources in most of the States are also not being compiled in LUS. In case of cropped area irrigated by two different sources, e.g. canal and well, it is recorded under canal only. Data are some times based on sample surveys and ad hoc assessments in certain areas which introduce limitations. Besides, the LUS data do not give information on the number of minor irrigation structures.

- (ii) **Periodical Progress Reports** from State Government Departments provide financial provision for construction of MI Schemes in the public sector and actual construction of MI Schemes by Government or local bodies.
- (iii) **Annual Administrative Reports** compiled by the State Government Departments presented along with budget give details of budget provisions. In certain States there are no field agencies in the minor irrigation department to collect data relating to minor irrigation programs for their annual administrative reports. Further since minor irrigation program is dealt by more than one department of the State, the annual administrative report of irrigation department gives the statistics pertaining to works maintained by that department only.
- (iv) **Ad-hoc reports** prepared by various agencies from time to time on the basis of sample surveys to access the performance of minor irrigation works. The *ad-hoc* surveys are sometimes intended to throw light upon the socio-economic impact in certain areas for improving agricultural activities etc. The data collected on

irrigation works under such surveys have a definite purpose and accordingly the priorities and weightage given to irrigation data for such minor irrigation statistics suffer from several deficiencies between the sets of progressive figures compiled on the basis of these statistics.

- (v) **Agriculture Census** provides information on the basis of records maintained as part of Agricultural Statistics about the number of irrigation sources by type, e.g. Tanks, Wells, Tube Wells in use and out of use by types of social classes and size class of farmers owning these assets. Agricultural Census also provides data on area irrigated by the different sources of irrigation by social classes as well as by size class of holding of farmers once in five years.

- (vi) **Input survey** as part of Agricultural Census is also done on sample basis, under which information on number of MI schemes is also obtained as per use for irrigation along with cost of irrigation.

- (vii) **Cost of Cultivation Studies(CCS)** conducted to estimate the average cost of cultivation of different crops across states by the Agricultural Universities also provide some information on use of minor irrigation schemes and cost of irrigation by different sources by state and by crops. However these data are not available for analysis and further use by the various stake holders for policy purposes.

---*---*---

CHAPTER 2

DEVELOPMENT OF MINOR IRRIGATION AND ITS ORGANIZATION IN THE STATES

2.1. HISTORICAL BACKGROUND

Minor Irrigation works are of different sizes and for varying uses and as such are controlled and monitored by different departments and organizations in the state governments. The availability of ground water, its level and terrain varies from region to region and from state to state in this sub-continent. In the plain areas with mainly alluvial soil created over the years by flow of many rivers in the north-central, eastern and north-western part of India generally has plenty of ground water at reasonable depth. These areas are also historically very well developed with a number of major and medium irrigation projects. However, due to very high growth of population and very good climate besides plenty of fertile land for growing different crops in all the seasons provided great opportunity for agricultural production and its diversity. Therefore, in spite of water availability from major and medium irrigation projects ground water based minor irrigation schemes have been taken up in large numbers in this area.

In the Southern tropical region with older but not so high mountains and plateau region with coastal areas on the two sides of the peninsula south of Vindhya ranges, the availability of ground water is limited. There are significant forest areas in central India and in the Eastern and Western Ghats with uneven terrain and very few perennial rivers. As such in Southern and Central states, mainly pond/reservoir based surface water schemes have been constructed/used by farmers. There has been some development in major and medium irrigation projects also in this part, still with better technologies available to

extract water from deep aquifers and availability of irrigation through pipes in uneven terrain with the help of drip and sprinklers; the potential for minor irrigation is growing in central and southern India also.

2.2. DEVELOPMENT OF MINOR IRRIGATION

Financial provision is being provided in different states to construct minor irrigation schemes either through department of irrigation/ Minor Irrigation, Water Resources Development or under PWD/local bodies for development of MI works and for management of on farm irrigation systems and water distribution devices. Further in many states subsidy is being provided for construction of minor irrigation works, for drilling/boring of tube wells, for digging of wells, purchasing water distribution devices and micro irrigation equipments like pipes, drip and sprinkler systems. With deepening of water level in many states more and more deep tube wells are being installed in place of shallow tube wells. Under rural development schemes also construction of ponds, percolation tanks, tube wells and diversions and that of water channels etc. have been taken up. The Department of Rural Development of Government of India operates a centrally sponsored scheme “Integrated Rural Development Programme” under which subsidies are made available to the farmers for development of minor irrigation schemes. Some other schemes are Jawahar Rozgaar Yojana, employment assurance scheme and million wells scheme which also provide support for renovation of ponds, tanks, construction of bunds and wells

besides creating self-employment opportunities on land based activities. In drought prone areas also in many states, MI works have been taken up and under tribal development programme also surface irrigation works are included for financial support.

Funds for construction of private minor irrigation works and grants from Government of India as well as loans from banks are also provided through the recommendation of Planning Commission and Finance Commission. Over the years share of Government of India, co-operatives/ Panchayats, local bodies in ownership of MI schemes has gone down and more and more MI schemes are being constructed by individual farmers or group of farmers either with their own savings or with support and financing through banks. However, information on construction of MI schemes is not available from the budget documents or Annual Progress Reports of the State Governments. Since no single Government Department is involved in development of minor irrigation works and a large number of private works are being constructed over the years in the states with or without support from State Government, co-ordination and monitoring of information about minor irrigation works becomes difficult even at the state level. Planning Commission in the Government of India also compiles the data on minor irrigation schemes as per the information available during Annual Plan discussions. However, the data provided by State Governments were not found consistent and fully updated.

is implemented by Minor Irrigation Statistics Division of the Ministry of Water Resources, Government of India. Under this scheme a Statistical Cell is established in each of the states/UTs for compiling information on funds provided for development of MI works by different departments and resultant growth in irrigation potential created and utilized besides gross area irrigated, net area irrigated during different seasons and under different crops on annual basis. Under RMIS scheme these statistical cells help in conduct of quinquennial (once in a 5 years) census of MI works. The census involves collection of data on location, source of energy, type of water distribution channel/device, social class of owners, holding size of owners, irrigation potential created/utilized and gross area irrigated by crops and seasons, scheme wise for all individual MI schemes in the country. The exercise involves huge amount of collection of data by physically visiting the irrigation structures spread over the cultivated area in the villages across country after detailed discussions with the owners of the schemes (farmers) and with the help of primary workers involved in collection of agricultural statistics and land use statistics in the states/UTs. After the data collection for all the villages and all the schemes, the same are processed with the help of software using computers by the MI statistics cells in the states and state wise reports are generated by these statistical cells.

---*---*---

2.3. MINOR IRRIGATION STATISTICS

Keeping this in view a central scheme “Rationalisation of Minor Irrigation Statistics (RMIS)” was launched in 1987-88. This scheme

CHAPTER 3

CENSUS OF MINOR IRRIGATION SCHEMES

3.1. MINOR IRRIGATION SCHEMES

Minor Irrigation schemes contribute a major share in the growing irrigation across the country accounting for about 65% of the total Irrigation Potential Utilised (IPU). Irrigation schemes using either ground water or surface water and having a Culturable Command Area (CCA) of less than 2000 hectare individually are categorized as Minor Irrigation Schemes. The schemes have been categorized broadly into five major types; (1) Dug wells (2) Shallow tube wells (3) Deep tube wells (4) Surface flow schemes and (5) Surface lift schemes. The need for conducting the census of Minor Irrigation arose as it was felt that a database of these schemes will serve the planning, development and management needs of irrigation in the country which contributes to growth of agriculture in a big way. For effective implementation of policy and planning, sound database regarding Minor Irrigation Sector is a must. The inadequacy of data has been considered as a serious constraint at various fora of irrigation planning. The National Commission on Agriculture had recommended that "Census of irrigation sources should be undertaken along with the Agricultural Census once in 5 years and special irrigation surveys on the number of wells and their utilization may be undertaken by the States" (recommendation 24/page 141 Volume-XIV). Planning Commission in 1970 also recommended for a detailed census of minor irrigation works.

3.2. CENSUS OF MINOR IRRIGATION SCHEMES

The First Census of Minor Irrigation schemes was conducted with reference year 1986-

87. The first minor irrigation census could not be conducted in Rajasthan due to non-cooperation of Patwaries. The Second Census with reference year 1993-94 was conducted in all States and Union Territories, except Gujarat, Maharashtra and UTs of Chandigarh, Daman & Diu and Lakshadweep. In 2nd MI Census, work could not be completed in Maharashtra and Gujarat due to administrative reasons in the State. In case of Karnataka and Tamil Nadu the census was completed in time but due to delay in finalization of the results, it could not be included in the national level report.

The Third Minor Irrigation Census with reference year 2000-01 was conducted in all States and Union Territories except Daman & Diu and Lakshadweep. This Census, the fourth in the series, has been conducted with reference year 2006-07 in all States and Union Territories except Daman & Diu and Lakshadweep. Like the 3rd Census, the 4th MI Census was also conducted in 33 states and UTs except Daman and Diu, Lakshadweep. The methodology of the census was the same as the earlier one with the difference that the states were asked to carry out the data entry of the schedules in parallel in the district headquarters as against the data entry at the state headquarters done during the 3rd MI Census.

In the 4th MI Census, the number of schedules was reduced from 6 to 3. One village schedule for collecting information for each village, one schedule for all the three types of ground water schemes and one schedule for two types of surface water schemes were canvassed. The format of the schedules used in 4th MI Census is given in Annexure-II. For the first time a new column on the cost of the scheme, cost of maintenance, source of funding, type of energy

used was introduced in the schedule. The field work started in July, 2007-and continued up to June, 2009. The states started the data entry work after the field data collection work was complete. Thus, the data entry continued up to March, 2010. The validation of data was then taken up in April, 2010.

Once the data was received from all the states it was compared with the previous census data and some inconsistencies were noted. All the concerned states were asked to verify and correct data and intimate the validated data to this Ministry. Simultaneously a study was done by NIRD to validate the results of 4th MI Census. The results of this study being significantly different from the 4th Census, CWC was also asked to check the data with the help of local offices in the concerned states. The reports of NIRD and CWC were not in line with the 4th MI Census report. Hence the publication of report at the Central level was delayed as the states were then advised to revalidate their data and send the corrected & consistent data. After receiving the corrected and consistent data from all the states, the national level report was finalized in the present form.

The following reports have been generated from the data of 4th MI Census:

INTEGRATED TABLES:

These Tables contain the aggregate data on key items for all types of schemes, viz. Number, Irrigation Potential Created, Irrigation Potential Utilised for MI schemes in Use and not in use, Crop-wise irrigation, Source of finance for construction of schemes in private sector, distribution by social category, type of farmers, e.g., marginal, small, big farmers, use of distribution devices, constraints in utilization of

MI schemes. These Tables provide data state-wise on all the above aspects for the reference year, i.e. 2006-07.

SCHEME-WISE TABLES:

These contain detailed tables on other important aspects of MI schemes separately by type of schemes. The items covered are ownership of the scheme, holding size, cost of construction, distribution device, social status of owner, type and status of scheme, source of finance and water lifting device. The scheme-wise Tables also provide data state-wise for each state/ UT separately on each variable. The state-Tables provide data on the pattern of Integrated Tables District-wise for each state on the variables as applicable for the concerned state. State-wise tables are provided in the appendix. The further details below district level are available for users and can be obtained through special request made to the Ministry giving the clear specific purpose after due approval through NIC central unit in the Ministry.

---*---*---

CHAPTER 4

METHODOLOGY OF MINOR IRRIGATION CENSUS

4.1. DATA COLLECTION

Methodology for conducting Minor Irrigation Census involves canvassing paper based schedules for collecting the village level data and the MI scheme-wise data from the rural areas. The data collection work in the schedules is done at the village level and then aggregated at the Block/ District level. The data entry work is done only after thorough scrutiny of schedules. Data entry is usually done at District or block level or as per availability of resources with the State Nodal Department. States make efforts to complete the field work and data entry in one year's time. Thereafter the data are processed and validated for errors if any. Once the validated data CDs are received from the states, the final tables are generated at the Central level.

The Census data are collected through canvassing different enumeration schedules for the village and Minor Irrigation schemes separately in different pre-designed schedules. The Village schedule is normally canvassed by the Patwaries through revenue / land records maintained in the office of Government Authorities and enquiries from village level workers/gram pradhans etc. and the M I Scheme related schedules are canvassed by the enumerators through enquiries from the owners of the schemes. In case of institutional schemes, the information is collected through available records. The schedules of enquiry along with instructions for filling are provided to the primary enumerators separately.

During the field work, supervision and checking is done by:-

- i. Block level officers
- ii. District level officers
- iii. State level officers as per the prescribed norms.

Central team along with the state Statistical Cell officials do visit the field in the state/UTs and check the quality of field work.

4.2. CO-ORDINATION PROCESS

A Steering Committee is formed in each State with Secretary of the Nodal Department as Chairman and members from the State Departments of Revenue, Irrigation, Panchayati Raj, State Planning, DES, Rural Development to provide technical inputs and guide the State Nodal Statistical Cell during the Census operations.

Teams are formed at state level which will include staff of the state Statistical Cell, for conduct of census in the state. These teams are entrusted with the work of training, monitoring, coordination, supervision of the census exercise in the state. Thus the technical staff of the state statistical cells are trained during the State Level Trainings organized by the Centre.

Training module is standardised in English/ Hindi for uniformity in imparting training.

4.2.1. Training Programme for Data Collection

A training cum Workshop for the Trainers is organized at the Central level in New Delhi in which 2-3 officers from each States/UTs participate. State level training workshops for the trainers are organized for all the States/UTs in the concerned States/UTs. The trained officers from the States/UTs function as trainers at the

State/ District level training workshops. They impart next level State trainings to be organised by the Minor Irrigation Census Commissioners at the State/District Headquarters in which the District Level Officers/ Block Level Officers and enumerators are trained. A representative from the Centre participates as an Observer in some such State level trainings. In addition the District level officers from all the districts, state level NIC officers, SASA/DES Head attend the State trainings. Thus there are 7 to 8 participants in addition to the number of District officers from each state in the training. The details of the methodology adopted for the census, its procedure, concepts and definitions etc. are discussed thoroughly and necessary clarifications are given. Each State has to intimate the district level Training schedule in advance to the Centre so that a representative from the Centre can participate in some of these trainings.

4.3. FIELDWORK

The MI Census is conducted under the overall charge of MI Census Commissioner who is a Senior Officer of the nodal department of State / UT concerned. The fieldwork is either be undertaken by the nodal department itself or is entrusted/ outsourced to some other agencies which the State/UT Government considers fit in respect of infrastructure available with it under intimation to this office. However, for the entire census operation Minor Irrigation Census Commissioner of the State/ UT is the pivotal point as far as Government of India is concerned and he is entitled to draw the honorarium for the State level officer. The primary work of collection of data is carried out by the primary enumerators. They are usually village level workers or village accountants or Lekhpals or Patwaries or any other official designated by the State/

UT Government. The work of supervision is entrusted to higher supervisor level officers of the field agency. However the overall quality of field work is monitored by Block/District level State officers, who in order to ensure the correctness of data have to conduct frequent site visits of the schemes and check the entries made by primary enumerators. Only the officers inspecting/ supervising the field work are entitled to draw the District/ Block level honorarium.

The primary enumerators while canvassing the schedules visit the owner of the Minor Irrigation Schemes or its next neighbour and collect information on the basis of personal enquiry from him. The physical verification of the schemes is also done by the enumerators. The purpose of the Census is explained to the farmers to win over their confidence in revealing the specific information in respect of Minor Irrigation works. Assurance that the data furnished by them would be kept confidential is given to the farmers. Certain information relating to the scheme is collected by the enumerators by physical examination of the scheme. After filling up the schedules, the enumerators are required to deposit all completed scheduled with the Block development Officer/Officer-in-charge at the block level.

4.4. SAMPLE CHECK

The block level officer have to visit at least 5 villages in his blocks and physically verify the schemes covered, quality of census and the extent of coverage of schemes in the village and scrutinise at least 10% schedules, in order to ensure the correctness of data collected. On completion of the scrutiny and after the field visits, he fills up the Supervisor's report form and submits it to the state nodal office. He submits

all the schedules to the district level officer concerned where the data are first scrutinized by the district level officer. At least 1% of the total schedules are selected at random and scrutinized by the district level officer. The district level officers have to visit at least 5 villages in 5 separate blocks to physically verify the quality and coverage of the MI Schemes in the census. After the field work is completed and scrutiny of forms is over, the supervisor's report form is filled up by the district level officers and is submitted to the state nodal office with a copy to the centre. The Monthly Progress Reports on the Census are sent by the State reflecting scrutiny /inspection details along with field work. The schedules are handed over to the selected agency for data entry, in the prescribed format and the CD containing data as well as the schedules are passed on to the Minor Irrigation Census Commissioner of the State/UT. For the processing of data, the software developed by NIC, Delhi, is used for data entry, validation and tabulation.

Frequent inspection and sample check are also done by officers from the Central Statistical cell in the Ministry.

4.5. FINANCIAL ASPECT

As a token of appreciation of work entrusted to various officials in addition to their normal duties and not as compensation or remuneration for additional work, the officials who are involved in the inspection of field work and schedules at the District/ Block levels are paid suitable honorarium which is drawn from the grants released to the states/UTs by the Ministry of Water Resources for the Census. The rates of grant towards honorarium, are decided for different administrative levels for primary and

supervisory work. The honorarium for each district and Block is fixed and only one officer from each District and Block who goes to the field for physical verification of the filled in schedules receives the same. Funds for contingency are also provided for various training and meetings etc. and for printing of schedules, miscellaneous expenses.

4.6. COMPUTERISATION OF CENSUS DATA

The National Informatics Centre (NIC), Ministry of Water Resources develops necessary software for computerising the Census data. Such software in Computer media is provided to Minor Irrigation Census Commissioners for computerising the Census data. If necessary, private consultants/agencies are hired by the Minor Irrigation Census Commissioners, under intimation to the Centre, to digitise the primary enumeration schedules, according to software provided by NIC. It minimizes the delays in computerization. The CD containing validated data are prepared and after duly ascertaining the correctness of data two copies are passed on to the Minor Irrigation Census Commissioner at the State level. One CD is sent to the Centre by the State Minor Irrigation Census Commissioners.

The Census data received from the States at the Centre are again be scrutinized and referred to States for necessary corrections. The corrected data are utilised for compiling National Level Report. The processing of the report and generation of tables is taken up with the help of Water Resources Informatics Division of NIC of the Ministry in New Delhi. The State Census Commissioners use the corrected data for generating micro level tables as per their requirement. The tabulation plan is supplied to the States /UTs by the Ministry.

4.7. MONITORING OF PROCESS

State/UT Governments submit Monthly Progress Report regarding the Census work in the prescribed Performa to the Ministry by post/by Fax/email or online through the software provided

by the Ministry. This helps in monitoring the progress of Census work, taking remedial measures wherever called for. The states also do devise their own mechanism to monitor the flow of work regularly.

---*---*---

CHAPTER 5

RESULTS AND SALIENT FINDINGS

The 4th census of Minor Irrigation (MI) schemes was conducted with reference year 2006-07 across the country in 33 states and UTs except Daman and Diu and Lakshadweep Islands. The census covered 609 districts in India and over 6 lakh 41 thousand villages in the country. It involved large scale collection of data for more than 2.1 crore minor irrigation structures and was completed by primary workers in the states under the over all supervision of state nodal departments for minor irrigation statistics under RMIS schemes. For analysis, the whole country has been divided into seven (7) regions with regard to the soil and terrain conditions. These are as given in Annexure-I.

Some of the important findings of the census are presented in the following paragraphs.

5.1.NUMBER OF MINOR IRRIGATION SCHEMES

There has been significant increase in the number of minor irrigation structures in the country as observed during the 4th MI census as compared to that in the 3rd. In all 21 million MI schemes were enumerated in 4th census as against 19.7 million found during the previous census. There has been significant growth in ground water schemes from 18.5 million to 19.75 million during the period from 2000-01 to 2006-07. Marginal decline has however been observed in the number of surface water schemes which remained around 1.2 million in number. Uttar Pradesh possesses the largest number of MI schemes in the country (42.8 lakh) followed by Andhra Pradesh (23.1 lakh), and Maharashtra (22.7 lakhs). Tamil Nadu (19.12 lakh) and Madhya Pradesh (19.06 lakh) also have large number of MI schemes. In Surface Water schemes, Madhya Pradesh (2.39 lakh) possesses the largest number of MI schemes followed by Maharashtra (2.19 lakh), Karnataka (1.21 lakh), Andhra Pradesh (1.06 lakh) and Odisha (0.89 lakh).

Table 1:Leading States in Number of MI Schemes

S. No.	Dug Wells	Shallow Tube wells	Deep Tube wells	Surface Flow Schemes	Surface Lift Schemes
1	Maharashtra	Uttar Pradesh	Punjab	Andhra Pradesh	Madhya Pradesh
2	<i>Tamil Nadu</i>	Andhra Pradesh	<i>Andhra Pradesh</i>	<i>Maharashtra</i>	<i>Maharashtra</i>
3	Madhya Pradesh	<i>Punjab</i>	Rajasthan	Chhattisgarh	Karnataka
4	Rajasthan	Karnataka	Tamil Nadu	Madhya Pradesh	Odisha
5	Andhra Pradesh	Bihar	Gujarat	Jharkhand	West Bengal

Classification of Districts

Map 1: Classification of the Country as per Soil and terrain

Source: IWMI, Anand

5.1.1.Over all Leading States

From the Table 1 it is observed that for each type of M I Scheme, a different state is leading in number indicating the favourable conditions for that type of schemes in that state. While Uttar Pradesh and Punjab are most important for tube wells (Shallow and Deep respectively), Maharashtra is most important for dug wells. Maharashtra is also very important state for surface water schemes, but the leading state for surface flow schemes is

Andhra Pradesh and Madhya Pradesh is the state with highest number of surface lift schemes. Considering the different leading states by type of M I Scheme, it is reasonable to give consideration for development of adequate number of appropriate schemes in different states and in the specific districts given the conditions of availability of water, holding size, requirement of irrigation for the suitable crops grown in the region concerned.

Map 2: Density of MI Schemes per 1000 Ha Net Sown Area

Source: IWMI, Anand

Table 1a: Number of MI Schemes during 3rd and 4th Censuses (in lakh)

Type of scheme	Number of MI Schemes During 3 rd census (2000-01)	Number of MI Schemes During 4 th census (2006-07)	Growth (%)
Dug-wells	96.2 (49)	92 (44)	-4.37
Shallow Tube-wells	83.5 (42)	91.2 (43)	9.22
Deep Tube-wells	5.3 (3)	14.4 (7)	171.70
Ground Water	185 (94)	197.6 (94)	6.81
Surface Flow	6.4(3)	6.0(3)	-6.25
Surface Lift	6.1 (3)	6.5 (3)	6.56
Surface Water	12.5 (6)	12.5 (6)	0.00
Total	197.5	210.1	6.38

Figure 1: Distribution of MI Schemes by type

As during the previous census, predominance of dug wells and shallow tube wells has been observed during the 4th census however, there has been decline in the number of dug wells from 96.2 lakh during the 3rd census to about 92 lakh in the 4th census. The number of shallow tube wells and deep tube wells have substantially increased from 83.5 and 5.3 lakh respectively to 91.2 and 14.4 lakh. On the other hand, there has been decline in surface flow schemes from 6.4 lakh to 6.0 lakh while the surface lift schemes have increased from 6.1

lakh to 6.5 lakh. As such, there has been shift from dug-wells and surface flow schemes to tube wells and surface lift schemes. While the share of Ground Water schemes has remained same, the share of dug-wells has declined from 49 to 44 %, while that of tube wells has gone up from 45 to 50% during this period. There has not been much change in the share of Surface Water Schemes although surface lift schemes have marginally increased in number, while there is net decline in number of surface flow schemes.

Numbering more than 9 million each, dug-wells and shallow tube wells dominate the minor irrigation landscape in India. While dug-wells are spread across western and peninsular India; shallow tube wells are concentrated in the alluvial indo-gangetic plains of north India, Karnataka and Andhra Pradesh. Deep tube wells number nearly 1.5 million and their density is highest in the groundwater hotspots – Punjab, north Gujarat and Tamil Nadu. Surface flow and surface lift schemes are relatively fewer in number – 0.60 and 0.65 million respectively. Surface flow schemes contribute significantly to minor irrigation in the mountain regions – Himachal Pradesh, Uttaranchal and Nagaland. Surface lift schemes are abundant in MP, Maharashtra and Karnataka.

5.1.2. DENSITY OF M I SCHEMES

On average, there are 150 minor irrigation structures for every 1000 Ha. of Net Sown Area (NSA). The highest density is observed in the western Indian plains (187), followed by peninsular India (177). Eastern India has about the same density as the national mean (153) while the central Indian tribal heartland lags behind with only 113 structures per 1000 Ha. Dug- wells and Shallow Tub wells account for 83-92% of the structures in the different regions.

Density of MI schemes during 2006-07 was 133 in one thousand ha Net Sown Area (NSA). Among the states with large density are Punjab (298), Tamil Nadu (280), Uttar Pradesh (239) and UT of Delhi (262) per thousand Ha operated land. The major states with low density include Assam (36) Rajasthan (72), Chhattisgarh (80) and North-Eastern states w.r.t. MI schemes per thousand Ha operated land (App. Table 1). There has been very good growth of over 77% during the period 2000-01 to 2006-07 in density

of MI schemes from 75 to 133 MI schemes per thousand Ha operated land (App. Table 2).

The density of MI schemes is comparatively much low in the tribal areas with only 66 MI schemes for one thousand Ha NSA. Comparative position of MI schemes with Scheduled Caste farmers is much better and their average is 132 as against 133 the over-all national average (App. Table 2). When we analyse the ownership of MI schemes per thousand Agriculture holdings, it is observed that on the average one in six holdings has a MI scheme. However, the share of MI schemes in holdings belonging to SC/ST farmers is comparatively lower and this is about one MI scheme for every 9 agricultural holdings (App. Table 3). Holding-wise possession of MI schemes has grown reasonably with about 27% growth during 2000-01 to 2006-07 with one MI scheme for every 8 agricultural holdings found during the third census to one MI scheme for every six holdings in 2006-07. There has been very high growth in this regard in the states like Assam, Madhya Pradesh, Orissa, Punjab, Sikkim, Uttar Pradesh and Karnataka. On the other hand, there has been decline in Bihar, Kerala, West Bengal and some North-Eastern states. In UTs also there has been decline in the number of MI schemes per thousand operational holdings. It is, therefore, desirable to increase efforts on water harvesting and artificial recharge so that more and more water is available for MI schemes (App. Table 4).

5.2. SCHEME-WISE POSITION

5.2.1. Dug Wells

There are 9.2 million dug wells in 609 districts of the country irrigating 15.6 million ha of land. Dug wells grew from 7.3 million in 1987 to 9.6 million in 2000-01. In 2006-07, however, the number of dug wells marginally declined to 9.2 million.

5.2.2. Region-wise distribution of Dug-wells

As it can be observed from the above chart that Peninsular India has highest density of Dug wells, while Central Indian Tribal Highland is the second high density region. It may be because of

difficult rocky conditions for deep drilling or less availability of ground water, uneven terrain with forests. The eastern Indian region has the least density of Dug wells. The highest concentration of dug wells is found in the hard rock areas of Saurashtra (Gujarat) and Tamil Nadu.

Map 3: Spread of M I Schemes across the country by type

Source: IWMI, Anand

Figure 2: Regional Distribution of Dug Wells per 1000 Ha Net Sown Area

Source: IWMI, Anand

5.2.3. Ownership of Dug wells

Dug wells are largely owned by marginal and small to semi medium farmers. 70% of the dug wells are less than 20 meters deep. The marginal and small farmers have the largest share in ownership of Dug wells (34, 32 % respectively).The medium and big farmers have very little share in ownership of Dug wells. Over 80 % Dug wells are owned by single individual farmers, (as over 96% are owned by private people) including 41% belonging to the Other Backward Castes (OBCs), while SCs (6%) and STs (8%) own comparatively less number of Dug wells. Only 2.8 % of Dug wells are owned by Government.

5.2.4. Use of Energy in Dug Wells

With regard to use of energy, about 69 % Dug wells use electricity as source of energy, while 15 % use diesel. Now only about 7 % are operated with the help of animals or are manually operated. Nearly 70% Dug wells are up to 20 meter deep and only 9 % are more deep than 70 meters.

5.3. SHALLOW TUBE WELLS

Shallow tube wells (STW) grew from 4.8 million in 1987 to 8.4 million in 2000-01. In 2006-07, the number of shallow tube wells grew further to 9.1 million. STWs are irrigating 31.4 million Ha of Land across 528 districts of the country.

Number of Dugwells | 2006-07 |

Map 4: Regional Spread of Dug wells

Source: IWMI, Anand

Figure 3: Regional distribution of Shallow Tube Wells per 1000 Ha Net Sown Area

Source: IWMI, Anand

5.3.1. Regional distribution of Shallow Tube Wells

The highest concentration of shallow tube wells can be found in the indo-gangetic plains of north India. The highest density is found in eastern plains consisting of Uttar Pradesh and closely followed by western plains in Punjab and Haryana. Andhra and Karnataka are also possessing significant number of STWs.

5.3.2. Ownership of Shallow Tube Wells

Largely privately owned structures belong to the marginal to semi medium farmers. They majorly (more than 66%) operate at a depth of 40 m or below and only about 7 % are deeper than 70 meters. The STWs are owned by marginal or small farmers to the extent of over 60% and only about 2 % by large farmers. The ownership

of SCs and STs is to the extent of 12 and 3 % respectively in case of STWs, which indicates that the tribal's share is quite low as compared to their share in population and agricultural population particularly.

5.3.3. Energy Use in Shallow Tube wells

The main source of energy to lift water from these structures, unlike other MI structures is diesel/ kerosene (53%), followed by electricity (38%). This may be because of non-availability of power in some states during the irrigation season or less number of hours when the electricity is available during the peak season. Some times there is power break-down due to lack/ delay in repair of transformers in the rural areas which results in use of diesel/ kerosene for energising the irrigation systems.

Number of Shallow Tubewells | 2006-07 |

Map 5: Regional Spread of Shallow Tube wells

Source: IWMI, Anand

Figure 4: Regional Distribution of Deep Tube Wells per 1000 Ha Net Sown Area

Source: IWMI, Anand

5.4. DEEP TUBE WELLS

Deep tube wells (DTW) have grown rapidly from 0.1 million in 1987 to 0.5 million on 2000-01 and more than 1.45 million in 2006-07.

5.4.1. Regional Distribution of Deep Tube Wells

Almost all of them are located in western and peninsular India, with a high concentration in Punjab and some in Gujarat, South Maharashtra and South Andhra Pradesh, North Tamil Nadu. There are about 1.45 million DTWs irrigating about 8 million Ha of land across 486 districts of the country.

5.4.2. Ownership of Deep Tube wells

Largely privately owned structures belong to the small to semi-medium farmers and primarily

use electricity to lift water mainly from 70 to 90 m depth. DTWs are largely owned by Other social category of farmers and as few as 2 % , 4 % are owned by STs, SCs respectively, indicating that they are possessing much less land and financial capacity to own DTWs.

5.4.3. Use of Energy in Deep Tube Wells

The source of energy for DTWs is predominantly electricity (over 86%), but about 8 % are still operated with diesel, which may entail very high cost. There are 12 % Deep Tube wells having depth of bore more than 150 meters and about 13% with 110 to 150 meters depth.

Number of Deep Tubewells | 2006-07 |

Map 6: Regional Spread of Deep Tube Wells

Source: IWMI, Anand

Figure 5: Regional Distribution of Surface Flow Schemes per 1000 Ha Net Sown Area

Source: IWMI, Anand

5.5. SURFACE FLOW SCHEMES

Surface flow minor irrigation schemes grew from 461 thousand in 1987 to nearly 642 thousand in 2000-01. In 2006-07, the number of surface flow schemes has declined to 601 thousand even as the irrigated area continues to rise. There are 575 thousand Surface Flow Schemes currently being used to irrigate about 3.93 Million Ha of land in 466 districts of the country.

5.5.1. Ownership of Surface Flow Schemes

There is substantial private ownership in these largely government constructed /owned irrigation schemes. They are currently being used by mostly small farmers followed by marginal and semi medium farmers. Over 54% ownership

under private sector is with small and marginal farmers and over all 71% schemes are either in Public sector or owned by group of farmers because of requirement of large parcel of land.

5.5.2. Regional Distribution of Surface Flow Schemes

The Surface Flow schemes are more in peninsular India and Central Hard Rock region having little capacity for ground water and significant surface flow capacity. Over 62% such schemes are getting water from Ponds/ Tanks or reservoirs and about 16% are based on diversions constructed on water sources.

Number of Surface Flow Schemes | 2006-07 |

Map 7 :Regional Spread of Surface Flow Schemes

Source: IWMI, Anand

Figure 6: Regional Distribution of Surface Lift Schemes per 1000 Ha Net Sown Area

Source: IWMI, Anand

5.6. SURFACE LIFT SCHEMES

Surface lift minor irrigation schemes have grown from 493 thousand in 1987 to 647 thousand in 2006-07. Almost all of them are located in Peninsular India. There are 647 thousand Surface Lift Schemes currently being used to irrigate about 2.54 Million Ha of land in 480 districts of the country.

5.6.1. Ownership of Surface Lift Schemes

Majorly used on the rivers, these units are largely privately owned, though there is a noticeable presence of public owned schemes (about 14 %) owing to the public interventions in tribal highlands mainly consisting of Madhya Pradesh and Maharashtra, where Surface Lift Schemes are primarily used by marginal to semi medium farmers. The share of SCs and STs in ownership was 6 and 10 % respectively and marginal and small farmers possessed about 55% of the number of surface lift schemes.

5.6.2. Use of Energy for Surface Lift schemes

Owners mostly deploy electricity to run them (over 61 %) and about 26% are operated with diesel. The surface lift schemes are largely of mobile nature and can be used at many places. Even Tractors or Jugads (indigenously designed engine mainly used for transportation in the rural areas) are used to draw water in many areas with no electricity. These schemes are also use to draw water from drains, rivers where permanent schemes cannot be installed.

5.6.3. Sources of Water

Over 54% such schemes are drawing water from rivers, and about 11% from canal/ drains. About 16 % draw water from Ponds/ Tanks and about 14% from streams. This shows that the percentage of the storages being less than 100 cubic meters is high, indicating smaller potential for irrigation.

Number of Surface Lift Schemes | 2006-07 |

Map 8: Regional Spread of Surface Lift Schemes

Source: IWMI, Anand

About 9 % of MI schemes are located in the tribal areas and about 63 % of the schemes are owned by marginal and small farmers, while only about 3 % are owned by the large (big) farmers in the country. The position w.r.t. location of schemes in the tribal areas and the

ownership share of marginal and small farmers of MI schemes have remained almost same as during the 3rd Census.

A comparative picture on share of Public Sector in the various types of M I Schemes is presented below:

Table 2: Number & proportion of MI schemes by ownership

Scheme Type	Number Public owned		Number Individual farmer owned	
Dug-Wells	3,62,219	(4)	73,43,028	(80)
Shallow Tube Wells	1,53,601	(2)	86,11,344	(95)
Deep Tube Wells	59,612	(4)	12,14,434	(84)
Surface Flow	3,69,470	(61)	1,74,113	(29)
Surface Lift	92,715	(14)	5,12,859	(79)
Total	10,37,617	(5)	1,78,55,778	(85)

Note: Figures in brackets are percentage proportion

Figure 7: share of public sector in ownership of M I Schemes

In many states, e.g. Uttar Pradesh, Delhi, Punjab, Haryana and Nagaland, the proportion of MI schemes in Public sector is less than 1 %. On the other hand, in states like Chhattisgarh, Jharkhand, Sikkim and Manipur are having higher

proportion (above 60%) of MI schemes is in public sector (cooperative societies or government) and States like Himachal Pradesh, Jammu & Kashmir and Arunachal Pradesh are having proportion between 35% to 60% of MI schemes.

May be due to higher cost and large capacity for irrigation, deep tube wells are owned by public sector to a bit higher extent (4 %) as compared to less than 2 % in case of shallow tube wells, although this trend is on decline over the years. However across the states, public sector has significant share in deep tube wells, e.g. in West Bengal (99.40%), Assam (92.72%), Jharkhand (79.04%), Odisha (75.75%) and Himachal Pradesh (75.37%) whereas, Uttar Pradesh is having share about 61% and share of Uttarakhand and Chhattisgarh is nearly 48% and 42% respectively. On the other hand in case of shallow tube wells, only in case of Jharkhand, Chhattisgarh, Bihar and Himachal Pradesh, share of Public sector is high. So the shallow tube wells are largely owned by individual farmers and even deep tube wells are pre-dominantly owned by farmers themselves.

5.7.1. Social Distribution of Ownership of M I Schemes

Besides, there is social difference in ownership of wells. While Deep tube wells are owned more by General category farmers (owning large farms), more than half of shallow tube wells are owned by SC/ST and OBC category farmers. The share of STs is very low for both (about 2 %), mainly because of their largely forest surroundings and lack of availability of power and connectivity for transportation. The share of SC/ST farmers has increased during inter-census period in shallow tube wells, but their share has gone down in ownership of Deep Tube wells which require higher funds. So there is need to financially support the weaker sections in farmers for installation of deep Tube wells as the water level is gradually going down. Similarly more deep tube wells are owned by medium, big farmers as compared to marginal and small farmers due to their financial capability and needs of irrigation. However, the share of

small and marginal farmers has gone up during the inter census period in case of Deep Tube wells while the same has come down in case of shallow Tube wells. It underscores the need to look for the reasons for that, which may be due to location of smaller and marginal holdings in the regions with deeper water levels. And if it is so, the smaller farmers need to be supported for financing the cost of construction of Tube wells as per requirement.

M I schemes are now pre-dominantly owned by individual farmers and very few (less than 3%) are owned by public institutions. Out of the total 92 lakh dug wells, 73.4 lakh (79.8%) are owned by individual farmers, similarly out of 91.2 shallow tube wells 86.11 lakh (94.5 %) and out of 14.5 lakh deep tube wells 12.1 lakh (83.6%) are owned by individual farmers. Surface lift scheme are also pre-dominantly owned by individual farmers with 5.1 lakh (79.2%) out of 6.5 lakh owned by individual farmers. However, from among surface flow schemes about 64.46% (3.7 lakh out of 6.00 lakh) are owned by public sector.

It may be observed that about two-thirds of the owners of dug wells are marginal and small farmers put together and very few medium or big farmers own dug wells. So it is all the more important to provide finance on easy terms to them by the Government and the banks. Further, it is also observed that about three – fifth of the dug wells are owned by SC/ST/OBC farmers. So cheap financing is also necessary for inclusive approach in financial intermediation in development of minor irrigation. Dug wells by very nature are more common in less developed states w.r.t. irrigation development or ground water potential and these are owned by weaker section with lesser holding size, for which higher potential is not needed. So to improve their

financial condition and enable them to use their own funds to diversify agriculture with better and more appropriate seeds, other inputs, it is necessary to provide them financial support in the form of subsidy or loan at cheaper interest rates.

Considering the role of Government, or Panchayats and other organizations of society in construction of surface water schemes and

co-operative arrangements for use of water for irrigation, and less financial burden for investing money in construction of such schemes by individual farmers, there is higher proportion of weaker sections having ownership in these schemes. The comparative position about ownership of different types of M I schemes among SCs, STs is given in the table below:

Table 3: Share of SCs/ STs in Ownership of M I Schemes (%)

Type of Scheme	Share of Sch. Castes	Share of Sch. Tribes
Dug Wells	6	8
Shallow Tube Wells	12	3
Deep Tube Wells	4	2
Surface Flow	3	9
Surface Lift	6	10
All Schemes	8	5

As evident from the tables 2 above at Page 31, the share of Public Sector is maximum in Surface Flow Scheme at all India Level. However in some states, there are higher number of Surface Flow schemes in private sector, these are: Madhya Pradesh, Maharashtra, Nagaland, West Bengal, Assam, Meghalaya, Mizoram, and Uttar Pradesh.

5.7.2. Distribution by type of Owner

Like Ground water schemes, the share of marginal, and small farmers is comparatively low in ownership of Surface Flow schemes among private ownership. A comparative picture of shares of different size class of farmers for different M I Schemes is provided in Table 4:.

Table 4: Share in Ownership of M I Schemes by types of Farmers (%)

Type of Scheme	Share of Small/ Marginal	Share of Medium Farmers	Share of Big Farmers
Dug Wells	65.8	31.6	2.6
Shallow Tube Wells	64.0	33.8	2.2
Deep Tube Wells	42.5	51.0	5.8
Surface Flow	54.3	41.6	4.0
Surface Lift	54.5	42.5	3.1
All Schemes	62.9	34.1	2.7

From Table 4, it is observed that, ownership of small and marginal farmers is high in dug-wells and shallow tube wells as their cost is comparatively less and they require less land area. The share of large farmers is highest in ownership of Deep Tube wells and surface flow schemes. Over all, ownership of big farmers is

about 2.7 % in M I Schemes as a whole and the share of small and marginal farmers is about 63 %, since they are cheaper and take less time to construct, and provide own control on water for irrigation. Comparative position of average cost of construction of different types of M I schemes is given in Table below:

Table 5: Average Cost of Construction of M I Schemes During 2006-07

Type of Scheme	Average Cost of Construction During 2006-07 (Rs.)
Dug Wells	64,502
Shallow Tube Wells	50,930
Deep Tube Wells	1,05,845
Surface Flow	2,04,872
Surface Lift	75,154
All Schemes	69,266

From Table 5, it is evident that shallow tube wells are the cheapest to construct (with average cost about Rs. 50 thousand per scheme), and as such largest number shallow tube wells are getting installed across the country. The Surface flow schemes and deep tube wells are the most costly; besides flow schemes require much more area to store water, so they are prohibitively costly for an individual farmer. Dug wells are declining in number in most of the states which are comparatively developed in irrigation and agriculture, and in spite of being cheaper, they are decreasing in number except in a few states. On the Other hand, Shallow tube wells, comparatively cheaper and feasible M I Scheme, and surface lift schemes are increasing in number at a fast pace.

5.8. IRRIGATION POTENTIAL CREATED (IPC):

There has been significant increase in the Irrigation Potential Created (IPC) from the period of 3rd MI census to 4th MI census. The potential created has increased to 70 million ha in ground water schemes from 62.4 million during 3rd Census, and to 14 million ha from surface water schemes as against 11.9 during the earlier period. It is very important to note that there has been significant improvement in the Irrigation Potential Utilized (IPU) in ground water schemes and it has reached the level of 79% as against 72% achieved during the earlier period. However, there has been only marginal increase in utilization of surface water schemes from 58.5% achieved during 2000-01 to 57.6% as reflected in the 4th MI census. In many states

very high level of utilization (more the 90%) of MI schemes has been observed and these states include Haryana, Himachal Pradesh, Jammu & Kashmir, Kerala, Maharashtra, Uttar Pradesh, Uttarakhand and Puducherry. With regard

to the percentage utilization of surface water schemes, the performance of Goa, Chhattisgarh, Himachal Pradesh, Jammu & Kashmir, Kerala and Uttarakhand has been of the very high order (about 80% or more).

Figure 8: Irrigation Potential Created by type of Schemes

Figure 9: Irrigation Potential Created and Utilised by Type of schemes

Figure 10: Irrigation Potential Created and Utilised over the years

Another important improvement observed in 4th M I Census is the reduction in gap in potential created and potential utilized. While in the 3rd census, gap in IPC and IPU was almost double as compared to that in 2nd census, it is heartening to note that in spite of significant increase in the potential created by about 10 million ha in 4th MI Census, there has been a reduction in gap in potential created and potential utilized which was observed as around 20 million ha during 2006-07 as against 22 million ha found during the 3rd census (2000-01).

It may also be observed from the following table that although the share of dug-wells is large in number (about 42 %) but their share in irrigation potential is only about 26 %, while the share of Shallow Tube Wells being a bit higher (45%), but their share in IPC is also about 45% considering their higher per unit IPC. On the other hand the shares of Deep Tube wells and Surface Flow schemes in number are about 7% and 3% respectively, but their share in IPC are about 13% and 12 % respectively because of their higher IPC per unit.

Table 6: Share in No. of various types of MI schemes in use & IPC

Type of Scheme	Share in No. of schemes in use(%)	Share in IPC (%)
Dug-Wells	42.22	25.83
Shallow Tube Wells	45.01	44.67
Deep Tube Wells	7.10	12.84
Surface Flow	2.54	11.88
Surface Lift	3.13	4.79
Total	100	100

5.9. STATUS OF UTILIZATION OF MI SCHEMES:

Due to some reasons like inadequate power, less water discharge, siltation in rivers/canals, some MI schemes go out of use resulting in loss of irrigation potential. During earlier census, it was observed that about 11% schemes were found 'not in use' including 4% which were permanently 'not in use'. During the 4th census only 5.8% schemes were found 'not in use' and it included 2.7% which were permanently 'not in use'. So, there has been significant improvement in use of MI schemes. Here it may be important to note that in shallow tube wells and deep tube wells, the percentage of schemes 'in use' is more than 97.5%, while in case of surface lift schemes, 95.6% of the schemes were 'in use'. The minimum percentage of schemes 'in use' were the surface flow schemes (83.6%) and dug wells (90.9%). 6.52% of potential created was observed as lost for schemes 'not in use' during 4th MI census. During the earlier census, 8.26% of irrigation potential was lost during due to schemes 'not in use', as such there is an

improvement of about 2% in potential due to schemes being operational.

About 30 per cent of SW and 20 per cent of GW potential created by minor irrigation structures is not utilized. Among groundwater structures, percentage of utilization is lowest in Orissa, while for surface water structures, utilization is lowest in Andhra Pradesh and parts of Tamil Nadu. From the GIS maps given below, it is evident that North-western India possesses high percentage of IPU as a proportion of IPC as compared to the South-eastern and eastern India. Besides the distribution of MI schemes by type in the form of Ground water schemes being much more in this region, the availability of water is better and demand for intensive agriculture is high with better fertile soil and higher population density. Further, there are better transportation networks available in this region and it is less calamity prone. Even Major and medium irrigation [projects are more in this region to supplement water availability as evident from more supplementary irrigation by MI schemes in this region in the command area.

Table 7: Number and Proportion of MI schemes in use and not in use

Scheme Type	Total Number of MI Schemes In use	Number of MI Schemes not in use Temporarily	Number not in use Permanently
Dug-Wells	83,59,710 (91)	4,08,740 (4)	4,31,741 (5)
Shallow Tube Wells	89,01,021 (98)	1,29,481 (1)	74,163 (1)
Deep Tube Wells	14,16,810 (98)	21,937 (1)	14,217 (1)
Surface Flow	5,02,498 (84)	74,515 (12)	24,102 (4)
Surface Lift	6,19,354 (96)	21,039 (3)	7,345 (1)
Total	1,97,99,393(94)	6,55,712 (3)	5,51,568 (3)

Note: Figures in brackets are percentage proportion

Groundwater Potential Utilized (GW_PU / GW_PC)

Map 9: Ratio of Ground Water Potential Utilised

Source: IWMI, Anand

Map 10 : Ratio of Surface Water Potential Utilised

Source: IWMI, Anand

When we analyse the loss of irrigation potential, the states, viz. Rajasthan (with 3.1 lakh), Andhra Pradesh (2.6 lakh), Odisha (1.3 lakh), Tamil Nadu (1.11 lakh) and Uttar Pradesh (0.66 lakh) have suffered the most due to schemes being not in use. Rajasthan state had

lost 8.9 lakh Ha of potential followed by Andhra Pradesh nearly 7.83 lakh Ha, Odisha nearly 4.10 lakh Ha, Tamil Nadu 8.95 lakh Ha and Uttar Pradesh 6.68 lakh Ha irrigation potential lost during 2006-07 due to schemes 'not in use'. As far as Surface water schemes are concerned Andhra Pradesh followed by Karnataka, Odisha, Chhattisgarh and Tamil Nadu have maximum number of schemes 'not in use' and as a result Tamil Nadu has lost irrigation potential to the extent of 7.9 lakh Ha, Andhra Pradesh has lost 4.6 lakh Ha, Karnataka 2.9 lakh Ha and Odisha had lost 2.2 lakh Ha irrigation potential during 2006-07.

5.10. UNDER-UTILISATION OF SCHEMES:

For the MI schemes 'in use' under-utilization has been observed as gap between

irrigation potential created and irrigation potential utilized and recorded in the census. Out of 19.8 million schemes in operation, about 8.4 million schemes (40%) were under-utilized, with reasons like non-availability of adequate power supply or less water discharge, mechanical breakdown, siltation etc. In case of ground water schemes about 60% have been observed to function without constraint while in case of surface water schemes around 62% have been observed to function without constraint. In case of ground water schemes less discharge of water was the most important cause in potential lost of irrigation (44%) followed by inadequate power supply (11%). On the other hand, in case of surface water schemes, Storage not fully filled and less discharge were the two most important causes (25%, 18%) of loss of irrigation potential.

Under Utilisation of GW Schemes- by Types Of Constraints

Figure 11: Under-Utilisation of Ground Water Schemes by reason

Figure 12: Under-Utilisation of Surface Water Schemes by reason

Table 8: Distribution of Schemes with Constraints by type of Scheme

Type of scheme	MI Schemes Without Constraints	Total no. of MI Schemes in use	Total no. of MI Schemes	% Sch. without Constraints
Dug-wells	48,91,807	83,59,710	92,00,191	58.52
Shallow Tube-wells	61,55,789	89,01,021	91,04,665	69.16
Deep Tube-wells	7,89,469	14,16,810	14,52,964	55.72
Surface Flow	3,24,327	5,02,498	6,01,115	64.54
Surface Lift	4,49,544	6,19,354	6,47,738	72.58
Total	1,26,10,936	1,97,99,393	2,10,06,673	63.69

From the above Table, it may be observed that highest per cent-age of schemes running without constraints are in Surface lift and shallow tube well schemes. While Deep Tube wells and dug-wells have highest proportion of schemes facing constraints in running. In both these cases deepening of water level resulting in less discharge is the main cause for constraints, in

case of Deep Tube wells shortage of electricity is the additional cause for facing constraints, since Deep Tube Wells may run around the clock if power is available. Therefore improving the water level through rain water harvesting and other measures and increasing power supply may be given high priority to improve utilization of MI schemes.

5.11. SEASON/ CROP-WISE UTILISATION OF MI SCHEMES:

Information regarding utilization of irrigation potential of MI schemes during different crop seasons was asked during the census. The information collected indicates that there has been significant growth of utilization of irrigation potential during the Rabi season. The utilization of potential during Kharif season has increased from 20.58 mha during 3rd census to 26.5 mha during 4th census, during Rabi season the irrigation potential utilized has increased from 24.7 mha to 31.37 mha in the 4th census. However, there has

been a decline in utilization of irrigation potential for perennial crops from 4.18 to 3.69 mha and in case of other crops from 2.5 to 2.24 mha. It reveals that there is more utilization of irrigation potential for the major crops during Kharif and Rabi seasons. Out of the total Potential created for different seasons, the utilization is higher (81.92%) during Rabi season as compared to 78.47 % during the Kharif season. The comparative position was much lower in the 3rd Census with 62% and 65% respectively for Rabi and Kharif seasons. The irrigation potential utilized has also increased for the perennial and other crops as well.

Table 9: Area Irrigated in Ha. By Type of Scheme and Season

Season	Ground Water	Surface Water	Total MI
Kharif	2,22,53,032 (40)	40,73,572 (51)	2,63,26,604 (41)
Rabi	2,78,98,073 (50)	33,54,367 (41)	3,12,52,440 (49)
Perennial	32,66,518 (6)	4,22,408 (5)	36,88,925 (6)
Others	20,08,620 (4)	2,28,254 (3)	22,36,875 (4)
Total	5,54,26,243 (87)	80,78,601 (13)	6,35,04,844

Figure 13: Season-wise area irrigated by MI Schemes

Table 10: Season-wise IPC by type of MI schemes – in use

(Lakh Ha.)

Type of Scheme	IPC in Kharif	IPC in Rabi	IPC for Perennial	IPC in Others	Total IPC
Dug-Wells	77.32	110.16	10.85	3.39	201.71
Shallow Tube Wells	154.38	170.61	22.52	18.62	366.12
Deep Tube Wells	44.92	51.97	4.59	3.38	104.86
Surface Flow	45.68	30.81	2.24	1.52	80.25
Surface Lift	13.22	17.94	3.27	1.50	35.93
Total	335.51	381.49	43.47	28.41	788.88

5.12. WATER DISTRIBUTION DEVICE:

There has been improvement in water use efficiency and decline in wastage of water through use of improved water distribution devices over the years. As reflected in 4th MI census, about 55% MI schemes only distribute water through open kutchha channels and about 26% schemes distribute water through under-ground pipe or surface pipe leading to less wastage through leakage and evaporation of water. About 1% schemes

used drip irrigation and about 2% used sprinkler system for water distribution. During the 3rd census about 81% schemes used open channel which now has reduced to 'about 65%' during the 4th census including 10% by open Pucca channels. The percentage of schemes which used ground-water channel during 3rd census was 8% which has now increased to about 12% during the 4th census. As such there is a significant improvement in utilization of irrigation potential by improved water distribution system.

Figure 14: Shares of Water Distribution Devices

5.13. FINANCING OF MI SCHEMES:

The information as available from 4th census reveals that more than 70% of MI schemes are constructed by farmers with their own savings and about 10% by Government funding and about 13% financed by bank loan. The share of schemes funded by loan from money lenders is less than 3% and about 5% schemes are funded with the help of friends and relatives. As compared to the 3rd census the share of bank loan to construct dug wells has increased from 4% to about 13%

and share of use of own savings has reduced from 80% to around 71.7% which shows that banks are coming forward to provide loans for construction of dug wells or dug-cum-bore wells in more cases. In case of construction of shallow tube wells, the proportion of self-financing has increased from 66% during the 3rd census to about 68% during the 4th census and share of government funding has reduced from around 13% earlier to about 10%.

Figure 15 : Shares of various sources of Finance

5.13.1. Financing of Construction of Dug wells

With regard to financing of construction of dug wells, a very high percentage is funded by own savings of the farmers and bank loan is the next important source of financing. Similarly, the share of Government funding has marginally increased from 5.5% to 6%. It shows that the share of contribution from the financial institutions and government in financing the construction of dug wells has increased. During 2000-01, share of money lenders in financing of construction

of dug wells was over 8%, which has reduced to about 1% during 2006-07. On the other hand, the share of financing by others (friends and relatives) has increased from 2% to about 8% during the same period. Considering the cost of construction of Dug wells (MI schemes) being significant, it is for consideration of the Government to increase financing by bank loans and through subsidy specially in case of marginal and small farmers and those belonging to weaker section like SC/STs .

When we compare, the situation of financing across the states we observe very significant diversity. In Jharkhand, about ¾th of financing for construction of dug wells is provided by Government and in West Bengal about 47% and in Odisha about 28% support is provided by the Government. Similarly, in the states of Bihar, Kerala and Chhattisgarh the share of Government funding is between 15% to 25%. When we compare the share of bank loan for financing the construction of dug wells, we observe that in case of Chhattisgarh, it is about 53% followed by Karnataka about 38% and Odisha about 22%. These states provide higher percentage of bank loans for construction of dug wells. On the other hand, own savings are the largest source of the financing in most of the states and especially in Tamil Nadu (89%), Andhra Pradesh (86%), Uttar Pradesh and Madhya Pradesh (81%) and Maharashtra (78%). The share of money lenders is higher than the national average in Rajasthan (3.3%) and Madhya Pradesh (2.5%). On the other hand, in some states viz. Jharkhand, Maharashtra and Odisha, it is negligible. It shows that in these states money lenders have been almost removed from financing the construction of MI schemes. In case of Gujarat, there is a special situation where share of others (friends and relatives) is 62.6% and only in case of Bihar, Karnataka, Rajasthan and West Bengal it is significant. As such, varying situation is observed as far as financing of dug wells is concerned across the country and it is desirable to improve the efficiency of irrigation and water distribution, for which more government support and financial linkages may be provided to the farmers to construct MI schemes (App. Table 5).

5.13.2. Financing for Construction of Tube Wells

There is wide diversity in cost of

construction of tube wells across the country. The cost depends upon the depth of bore, capacity of motor and intensity of irrigation related to diversification of agriculture in the region. The states in which cost of construction of shallow tube wells is high include Gujarat, Haryana, Himachal Pradesh, Jharkhand, Punjab and Rajasthan (about Rs.60 thousand or more). On the other hand, in Assam, Kerala, Maharashtra, Odisha and West Bengal, average cost is quite low (in the range of 20 to 35 thousand Rupees). The cost in the other states is around the average all India cost, which include Uttar Pradesh, Bihar, Jharkhand, Madhya Pradesh, and Uttarakhand states. In case of deep tube wells, the position is a bit different with the states including Gujarat, Haryana, Himachal Pradesh, Odisha, Rajasthan, Uttar Pradesh, West Bengal and Uttarakhand having the high average cost mainly due to higher share of public sector tube wells with larger size. Except Tamil Nadu, which has about average all-India cost the remaining states have low cost of deep tube wells.

Over all, own savings are the premier source of financing with over 73 % of cost of shallow tube wells and about 65 % of deep tube wells financed by the own savings of the farmers at all India level. Across the states however there are significant differences. With regard to Shallow tube wells, the states of Chhattisgarh, Karnataka and Odisha provide significant share of financing by way of bank loans with 49 %, 37 %, and 25 % share respectively. The share of Government financing is high in Haryana (73 %), and significant in Odisha (16 %). The share of money lenders is significant in financing of shallow tube wells in Punjab (13 %), Andhra Pradesh, Karnataka and Madhya Pradesh (all over 5 %). On the other hand in Assam, Chhattisgarh, Haryana, Maharashtra, their share is nil or negligible. Interestingly the share

of Others (friends and relatives) is high (over 66%) in case of Gujarat and significant (5.5 %) in Karnataka states.

In case of financing of deep Tube wells, share of financing by banks is high in case of Chhattisgarh (over 50 %), Rajasthan (over 39 %) and significant in case of Haryana (about 21 %) as compared to the national average of about 12 %. As far as Government financing is concerned, the states of West Bengal (89%), Assam (87 %), Odisha (74 %) and Haryana (64 %) provide high share of financing of deep tube wells as compared to national average of about 6 % only. For share of money lenders, the farmers in the state of Punjab (with 30%) and Andhra Pradesh (about 6.5 %) are significantly under the clutches of money lenders for financing deep tube wells. Similarly, the share of friends and relatives is high in case of Gujarat state (over 54 %), and is significant in case of Bihar (8.5%) and Punjab (about 7 %). Since the national average of share of money lenders in financing of deep tube wells is over 8 % and the share of others is also at the same level, put together, it is observed that about 17 % of the total financing is in the un-organised financing sector. It is also observed that over 80 % financing is done by farmers themselves in many states, viz., Andhra Pradesh, Madhya Pradesh, Maharashtra and Uttar Pradesh. The role of money lenders needs to be eliminated through banks and financing support is desired at reasonable interest rates and feasible lending conditions to help farmers use their own funds in further improving their agri-practices for higher efficiency (App. Table 6).

5.13.3 Investment in Minor Irrigation

Very significant amount of investment has been done during the period 2000-01 to 2006-07 as revealed by the 4th MI Census. Till that year total investment worth Rs. 1 Lakh and

17 thousand crores was done in minor irrigation structures. During 2006-07 alone investment worth Rs.2402.58 crores was reported. The maximum investment has been in Dug wells including dug-cum bore wells amounting to about Rs.45101.85 crores closely followed by the Shallow Tube wells worth over Rs.44598.53 crore. The investment in Deep Tube wells is also significant with about Rs.14936.58 crores invested till 2006-07 and the invested amount being in the range of Rs.7364.06 crores and Rs.4900.01 crores respectively in case of Surface Flow and Surface Lift schemes. With over 95 per cent schemes being in the private sector including over 97 percent Tube wells with ownership in farmers hands, a large part of investment has been made by farmers themselves. With more mechanisation of water distribution in the form of Drip and Sprinkler systems, and likely growth of Solar powered MI systems being promoted, and surface pipes being used more and more, the investment in MI may increase significantly in future.

5.14. ENERGIZING MINOR IRRIGATION SCHEMES:

Electric pumps dominate much of western and peninsular India with high concentrations in Punjab and Tamil Nadu. Minor Irrigation pumps in UP, West Bengal and Assam are mostly powered by diesel. Tribal Chhattisgarh, Jharkhand and Orissa rely on manual pumps while farmers in Bihar run most of their pumps on kerosene.

5.14.1. Energy Consumption in MI schemes:

Nearly 72 billion units of energy (kWh-equivalent) are consumed by minor irrigation structures in India. Most tribal, eastern and Himalayan districts consume less than 50 million units per year. The “free-power” states of Punjab, Andhra Pradesh and Tamil Nadu, not surprisingly,

are among the highest consumers. Six districts (Amritsar, Sangrur, Punjab, Banaskantha, Nalgonda and Viluppuram) each consume more than 1 billion units per year.

5.14.2. Use of Energy in kWh per Ha. IPU:

A similar trend can be seen in kWh-equivalent energy consumption per hectare of

irrigation potential utilized (IPU). Tribal, eastern and Himalayas districts consume less than 500 kWh/Ha/year while several parts of Punjab, Haryana, Western Uttar Pradesh, Rajasthan, Gujarat, Andhra Pradesh, Karnataka and Tamil Nadu consume several thousand kWh per hectare of IPU.

Source: IWMI, Anand

Energy Divide [2006-07]

Map 14: Electricity intensity of MI Schemes across the country

Source: IWMI, Anand

5.14.3. The Energy Divide

The proportion of electricity-powered minor irrigation structures has increased between 2000-01 and 2006-07, especially in the water-

scarce western plains and peninsular India. Water abundant eastern India continues to be deprived of electricity and depends largely on diesel and kerosene for irrigation.

Energy Divide [2000-01]

Map 15: Share of Electricity out of total Energy used in MI Schemes across the Country

Source: IWMI, Anand

5.15. Irrigation through Tanks and Storages:

Surface water schemes provide irrigation through either gravity flow of water from Tanks, Ponds, reservoirs or other storages of water collected either from rain, streams, springs or

drainage of water from residential areas. Sometimes diversions are constructed on minor rivers/streams, or drains to help flow of water to take to fields for irrigation. Water bodies are also constructed to store water for recharge of ground water level to extract the same when and where the surface water

is not available for irrigation or other purposes. Besides the flow schemes, lift schemes are also taken up to take water from water bodies or rivers, streams, or springs to the fields where water supply to fields is not possible through gravity flow and either electricity or other fuel is available to operate the lifting devices. As such there are two types of surface water schemes, viz. Surface Flow and Surface Lift schemes in vogue under Minor Irrigation. Since these schemes require large areas for storing water, these are increasingly in public sector as compared to Ground Water Schemes. As per the 4th census about 5.76 lakhs tanks and storages in India are used for minor irrigation schemes under surface flow and surface lift and it has increased from 5.56 lakh during 3rd census. The major states which have large number of reservoirs and tanks include Andhra Pradesh (81 thousand), Maharashtra (71 thousand), Chhattisgarh (56 thousand), Madhya Pradesh (56 thousand), Odisha (39 thousand), Tamil Nadu (39 thousand), Uttarakhand (31 thousand), and West Bengal (30 thousand).

5.15.1. Utilisation of Surface Flow Schemes:

Out of these 6 lakh surface flow schemes including tanks 5 lakh schemes are in use and remaining 1 lakh schemes are not in use due to various reasons. The total irrigation potential created through tanks is about 58.9 lakh ha out of which 39.31 lakh ha has been utilized; as such about 1.95 lakh ha has been lost due to under-utilisation. Out of the surface flow schemes not in use 74 thousand were temporarily not in use and about 24 thousand were permanently not in use.

5.16. Supplementary Irrigation through MI Schemes

Minor irrigation schemes provide irrigation even in the command areas of major and medium

irrigation projects as supplementary sources of irrigation. As reflected from the 4th census results, 10.7% MI schemes are located in the command area of major and medium irrigation projects and 12.2% irrigation provided through MI schemes has been in the command area. While the percentage of schemes in command area has gone down from 3rd census by 1%, the area irrigated has increased in the command area during this period by about 5%. It has been observed that the shallow and deep tube wells and surface lift schemes are more and more coming up in the command area to provide supplementary irrigation for agriculture and specially horticulture crops.

Among states, Haryana (> 65 %) has the highest percentage of MI schemes inside command area particularly the tube wells followed by Punjab (> 35 %). In case of surface water schemes Maharashtra is the leading state where above 40% of the surface water schemes are in the command area.

5.17. Districts with Large Number of MI Schemes

In all there were 41 districts in India which possessed more than 1 lakh MI schemes during 2006-07. Karimnagar (Andhra Pradesh) with 2.40 lakh MI schemes was the leading district and another district Warangal in Andhra Pradesh, Ahmednagar, Solapur, and Nashik in Maharashtra had about 2 lakh or more MI schemes. Among top ten leading districts Andhra Pradesh had 5, Maharashtra 3, and Tamil Nadu 2 districts. However out of the districts having more than one lakh MI schemes, 8 belong to Uttar Pradesh, 7 each to Andhra Pradesh and Maharashtra, 6 in Tamil Nadu, 2 each in Gujarat, Punjab, Rajasthan, and Karnataka and one in Madhya Pradesh (Table A1). However when we consider the MI schemes in Use, 37 districts have more

than 1 lakh schemes except the districts of Rajasthan, one each of Andhra Pradesh and Tamil Nadu states (Table A2).

5.18. Districts with Large Number of Surface water Schemes:

With regard to Surface Water (SW) Schemes, there are 21 districts with 10 thousand or more MI schemes. Solapur (38048 schemes) in Maharashtra is the district which has the largest number of SW MI Schemes, followed by Sagar, and Jhabua from Madhya Pradesh, Kolhapur and Nagpur in Maharashtra with more than 19000 schemes. Out of top 10 districts, 4 each belong to Maharashtra and Madhya Pradesh, one each to Chhattisgarh and Karnataka (Table A3). Considering the SW schemes in Use also, the same districts have maximum number of SW schemes except one district of Chhattisgarh (See Table A 4).

5.19. Districts with Large IPC:

There were 18 districts during 2006-07, in which more than half million ha irrigation potential was created including 2 districts viz. Dhar in MP and Bareilly in UP where more than one million ha irrigation potential was created (Table A 5). Out of the top 20 districts in India with the largest Irrigation Potential Created (IPC), 9 districts belong to UP, 4 to Punjab and 2 each to Madhya Pradesh, Gujarat and Rajasthan and 1 district being in Maharashtra state. With regard to Irrigation Potential Utilised (IPU), Bareilly district of Uttar Pradesh had maximum IPU (10.78 lakh Ha). Out of 23 districts with 4 lakh Ha or more IPU in India, 12 belong to Uttar Pradesh, 5 to Punjab, 3 to Maharashtra, 2 to Gujarat and one to Rajasthan (Pl. See Table A6).

5.20. Districts with Large IPU :

There are 35 districts which possessed

more than one lakh Ground Water schemes “In Use” during 2006-07. Karimnagar and Warangal in Andhra Pradesh, Ahmednagar and Nashik in Maharashtra, Rajkot, and Junagarh in Gujarat, Sultanpur and Sitapur in Uttar Pradesh, Ludhiana in Punjab, Salem and Coimbatore in Tamil Nadu, Chittorgarh and Alwar in Rajasthan, Tumkur in Karnataka are among these districts (Kindly see Table A7). However, when largest IPU is considered, Bareilly in Uttar Pradesh is the leading District with more than one 1 Million Ha IPU in GW schemes in use. There were 42 districts in India with more than 3 lakh ha worth Irrigation Potential Utilisation (IPU) during 2006-07 in Ground Water (GW) Schemes in use. There are in all nine districts with more than half million ha IPU in GW schemes including 4 District of Uttar Pradesh, 4 from Punjab and Banaskantha District of Gujarat among such districts. Out of top 20 districts with highest IPU in GW schemes, 12 belong to Uttar Pradesh, 5 to Punjab and one each to Gujarat, Maharashtra and Rajasthan. (see Table A8).

5.21. Districts with Large IPU in Surface water Schemes:

Considering the largest IPU in SW schemes in use, Tirunelveli in Tamil Nadu has the maximum IPU. Besides there are five more districts in India with more than 1 lakh Ha IPU in SW schemes in use including Villupuram in Tamil Nadu, Aurangabad in Maharashtra, Korba in Chhattisgarh, Bankura in West Bengal, Ganjam in Odisha. Out of top 20 districts with highest IPU in SW schemes in Use, there are 5 districts from Andhra Pradesh, 4 from Tamil Nadu, 3 from Maharashtra, 2 each in West Bengal, Madhya Pradesh and one each in Chhattisgarh, Odisha, Jharkhand, and Uttarakhand states (Pl. See Table A9).

23

Percentage Distribution of Potential Utilised By Water Distribution Devices

24

Dug wells

There are 9.2 million dug wells in 461 districts of the country irrigating 15.6 million ha of land. Dug wells are largely owned by marginal and small to semi medium farmers. 70% of the dug wells are less than 20 meters deep.

Ownership by Land holding

Shallow Tube Wells (STW)

There are 8 million STWs irrigating 31.4 million Ha of Land across 528 districts of the country. Largely privately own structures belong to the marginal to semi medium farmers. The main source of energy to lift water from these structures, unlike other MI structures is diesel/ kerosene, followed by electricity. They majorly operate at a depth of 40 m or below.

Owner's Landholding Size

Deep Tube Wells (DTW)

There are 1.45 million DTWs irrigating 8 million Ha of Land across 486 districts of the country.

Largely privately own structures belong to the small to semi medium farmers and primarily use electricity to lift water mainly from 70 to 90 m depth.

Ownership

Depth

Source of Energy

Surface Flow

There are 575 thousand Surface Lift Schemes currently being used to irrigate about 3.93 Million Ha of land in 466 districts of the country. There is substantial private ownership in these largely government constructed /owned irrigation schemes. They are currently being used by mostly small farmers followed by marginal and semi medium farmers.

Social Status of Owner

Surface Lift

There are 647 thousand Surface Lift Schemes currently being used to irrigate about 2.54 Million Ha of land in 480 districts of the country. Majorly used on the rivers, these units are largely privately owned, though there is a noticeable presence of public owned schemes owing to the public interventions in tribal highlands where Surface Lift Schemes are primarily used by marginal to semi medium farmers, who mostly deploy electricity to run them.

CONCEPTS AND DEFINITIONS:

Cultivable Command Area (CCA):

The area which can be irrigated from a scheme and is fit for cultivation.

Cultivable area:

It consists of net area sown, current fallow, fallow lands, other lands, current fallow, culturable waste and land under miscellaneous tree crops.

Gross Irrigated Area:

The area irrigated under various crops during a year, counting the area irrigated under more than one crop during the same year as many times as the number of crops grown and irrigated.

Net Irrigated area:

It is the area irrigated through any source in a year for a particular crop. If any area is irrigated for more than one crop in a year, it will be counted only once.

Irrigation Potential Created (IPC):

The total gross area proposed to be irrigated under different crops during a year by a scheme. The area proposed to be irrigated under more than one crop during the same year is counted as many times as the number of crops grown and irrigated. If original Irrigation Potential of the scheme is not known then the maximum area irrigated during the past five year or so may be taken as the IPC.

Irrigation Potential Utilised (IPU):

The gross area actually irrigated during reference year out of the gross proposed area to be irrigated by the scheme during the year.

Minor Irrigation (M.I.) Scheme:

A scheme having CCA up to 2,000 hectares individually is classified as minor irrigation scheme.

Medium Irrigation Scheme:

A scheme having CCA more than 2,000 hectares and up to 10,000 hectares individually is a medium irrigation scheme.

Major Irrigation Scheme:

A scheme having CCA more than 10,000 hectares is major irrigation scheme.

Drip irrigation system:

Drip irrigation system delivers water to the crop using a network of mainlines, sub-mains and lateral lines with emission points spaced along their lengths. Each dripper/emitter, orifice supplies a measured, precisely controlled uniform application of water, nutrients, and other required growth substances directly into the root zone of the plant.

Photo 1: Irrigation by Surface Pipes

Photo 2: Drip Irrigation System

Sprinkler Irrigation System:

Sprinkler Irrigation is a method of applying irrigation water which is similar to rainfall. Water

is distributed through a system of pipes usually by pumping. It is then sprayed into the air of entire soil surface through spray heads so that it breaks up into small water drops which fall to the ground.

Photo 3: Drip Irrigation System

Photo 4: Working of Drip Irrigation System

Photo 5: Advantages of Drip Irrigation System

Non- Submersible or Centrifugal Pump:

The most common type of pump. Typically the pump is “close-coupled” to an electric motor, that is, the pump is mounted right on the end of the motor’s drive shaft and the pump case is bolted straight into the motor so that it looks like a single unit. The water typically enters the pump through a “suction inlet” centered on one side of the pump, and exits at the top. Almost all portable pumps are end-suction centrifugals. If the pump isn’t one of the next two types, then chances are it is an end-suction centrifugal.

This type of pump needs to be installed on a pad above the high water level if pumping from a lake or river.

Photo 6: Centrifugal Pump

Submersible Pump:

Submersible pumps are installed completely underwater, including the motor. The pump consists of an electric motor and pump combined in a single unit. Typically the pump will be shaped like a long cylinder so that it can fit down inside of a well casing. Although most submersibles are designed to be installed in a well, many can also be laid on their side on the bottom of a lake or stream. Another common installation method for lakes and rivers is to mount the submersible pump underwater to the side of a pier pile (post). Submersibles don't need to be primed since they are already under water. They also tend to be more efficient because they only push the water, they don't need to suck water into them. Most submersible pumps must be installed in a special sleeve if they are not installed in a well, and sometimes they need a sleeve even when installed in a well. The sleeve forces water coming into the pump to flow over the surface of the pump motor to keep the motor cool. Without the sleeve the pump will burn up. Because the power cord runs down to the pump through the water it is very important that it be protected from accidental damage

Photo 7: Submersible Pump s and Jet Pumps :

Turbines and Jet Pumps:

A turbine pump is basically a centrifugal pump mounted underwater and attached by a shaft to a motor mounted above the water. The shaft usually extends down the center of a large pipe. The water is pumped up this pipe and exits directly under the motor. Turbine pumps are very efficient and are used primarily for larger pump applications. They are typically the type of pumps used on municipal water system wells. The turbine pump is mounted in a large concrete vault with a pipe connecting it to the lake. The water flows by gravity into the vault where it enters the pump. The pump motors are suspended over the vault on a frame. A jet pump is similar to a turbine pump but it works by redirecting water back down to the intake to help lift the water.

Photo 8: Turbine

Water body:

All natural or artificial units with some or no masonry work used for storing water for irrigation or other purposes are covered under water bodies. These are usually of various types known by different names like tank, reservoirs, ponds and bundhies etc. The distinction among various types of water bodies, however, is not very explicit.

Pond:

A small body of water usually earthen though masonry dykes are also included and shallow made through excavations which represent a restricted environment. Ponds usually describe small bodies of water generally no one would require a boat to cross.

Photo 9 : Pond

Tanks:

A shallow water unit usually larger than a pond created by constructing earthen or masonry barricades which receives water either from tube wells or rains.

Reservoirs:

A large man made impoundment of varying magnitude created by erecting, bunds, dams barrages or other hydraulic structures across streams or rivers serving one or more purposes such as irrigation, power generation, flood control or other water resource development projects.

Photo 10: Reservoir

1. GROUND WATER SCHEMES

A. Dug-well: It covers ordinary open wells of varying dimension dug or sunk from the ground surface into water bearing stratum to extract water for irrigation purposes. These are broadly masonry wells, kuchcha wells and dug-cum-bore wells. Most of such schemes are of private nature belonging to individual cultivator. The parameter of the well ranges between 2 to 6 meters. and the depth between 8 and 15 meters. Their CCA generally varies from 1 to 2 hectares and in case of Dug-cum-Bore Well it may be as in case of a Tube Well of similar capacity and depth of bore.

Photo 11: Dug Well

Sources: "Water supply sources for the farmstead and rural home". FARMERS BULLETIN No. 2287, USDA.

DUG WELL

Photo 12: Design of Dug Well

B. Shallow tube-well: It consists of a bore hole built into ground with the purpose of tapping ground water from porous zones. In sedimentary formations depth of a shallow tube well does not exceed 70 meters. These tube wells are either cavity tube-wells or strainer tube-wells. These are usually drilled by percussion method using hand boring sets and sometimes percussion rigs. Success and popularity of the scheme depends on how cheap they are. A coir structure formed by binding coir strings over an iron frame is being used as strainer. In shallow water table areas, bamboo frames are also used. Sometimes steel pipe casing are replaced by pipes constructed by rapping bituminised gunny bags over the bamboo frame. These are called bore wells, in which bore-hole is stable without a lining in the bottom portion and a tube is inserted only in the upper zone. The tube wells are generally operated for 6 to 8 hours during irrigation season and give yield of 100-300 cubic meters per day, which is roughly 2 to 3 times that of a dug well. Their CCA may go up to 15 hectares.

Photo 13: Design of Shallow Tube Well

C. Deep tube wells: It usually extends to the depth of 70 meter and more and is designed to give a discharge of 100 to 200 cubic meters per hour. The deep tube wells are drilled by rotary percussion or rotary cum percussion rigs. These tube wells operate round the clock during the irrigation season, depending upon the availability of power. Their annual output is roughly 15 times that of an average shallow tube well and are usually constructed as public scheme which are owned and operated by government departments or corporations. Their CCA may go up to 50 hectares.

Photo 14: Deep Tube Well

Photo 15: Design of Deep Tube Well

Photo 16: Working of Deep Tube well

2. SURFACE WATER SCHEMES

A. Surface flow irrigation scheme:

These schemes use rainwater for irrigation purposes either by storing it or by diverting it from a stream, nalah or river. Sometimes, permanent diversions are constructed for utilising the flowing water of a stream or river. Temporary diversions are also constructed in many areas which are usually washed away during the rainy season. The small storage tanks are called ponds or bundhis which are mostly community owned. The command areas of such schemes are 20 hectares or less. The large storage tanks whose command varies from 20 to 2000 hectares are generally constructed by government departments or local bodies. These are the biggest items of surface minor irrigation works.

(i) Storage schemes (Tanks and other storages)

Storage schemes include tanks and reservoirs which impound water of streams and rivers for irrigation purposes. After wells, tanks occupy a very important place under the minor irrigation programme. They provide nearly two-third of the total irrigation from minor sources in the states of Andhra Pradesh, Karnataka, Kerala, Maharashtra, Orissa and Tamil Nadu. Tracts with undulating topography and rocky sub-strata are eminently suitable for tank irrigation. Besides, there exists scope for further construction of tanks in many areas. A large number of existing tanks in southern States have gone into disuse due to long neglect of repairs. Renovation of these tanks so as to restore the lost irrigation potential is being accorded priority under the minor irrigation programme.

The essential features of these schemes are

- a bund or a dam which is generally of earth, but is also sometimes partly or fully masonry,
- anicut and feeder channels to divert water from adjoining catchments,
- a waste weir to dispose of surplus flood water,
- sluice or sluices to let out water for irrigation, and
- conveyance and distribution system.

The size of the storage is determined by the run-off expected on the basis of dependable monsoon rainfall in the catchment and by the fact whether the rainfall and cropping pattern would permit more than one filling of the tank.

(ii) Diversion schemes :

These schemes aim at providing gravity flow irrigation by mere diversion of stream water supply without creating any storage. As compared to storage schemes they are economical but their feasibility is dependent on the presence of flow in the stream at the time of actual irrigation requirements. Essentially such schemes consist of

- a. an obstruction (weir) or bund constructed across the stream for raising and diverting water; the weir being called anicut in the South, bandhara in Maharashtra and Gujarat, and Bandh in the Assam region, and
- b. an artificial channel, known as kul in the hilly areas, pyne in Chhota Nagpur and Bihar and dong in the Assam region.

Photo 17: Permanent Diversion

Photo 18: Small Check Dam

Photo 19: Construction of Check Dam

Photo 20 : Check Dam in Gujarat

In case of small schemes which have prominent scope in the hilly tracts and foot hill plains, the water is usually diverted by constructing

temporary bunds across the streams, made up of earth, stones or even bamboos. The discharge handled being of small order, the bund on the head of the channel is not provided with any gated structure for controlling and regulating the flow. Construction of work, is, therefore, simple and cheap and can be handled to a large extent by the people themselves. However, these constructions being temporary, require frequent renovation. The bunds are liable to be washed away by every major flood. The channels also get silted up and scoured frequently. It is essential that whenever such schemes aim at diverting higher discharges, say more than 5 to 10 cusecs, or tackle streams having high intensity of flood discharge, proper regulation structures equipped with suitable types of gates are provided. Weir has to be provided with scouring sluices in order to regulate the flow of silt in the off-taking channels. The construction of masonry weir is comparatively simpler and cheaper where rocky foundation is available beneath the streambed. The design of the weir on permeable and erodible foundation is more complicated and requires specialised engineering knowledge.

Photo 21: Check Dam in Gujarat

The irrigation capacity of the diversion schemes is dependent on the actual flow in the stream at the time the irrigation is required. The cold weather and the hot weather flow, therefore,

need to be ascertained carefully before deciding the feasibility and economics of these schemes. This is particularly important in the case of non-snow fed flashy streams that spurt to lift suddenly in the rainy season after which the discharge in them dwindles down to appreciable quantity. Some diversion schemes are also constructed as kharif or monsoon channels supplying water only during the monsoon season. Such schemes are useful for providing supplemental irrigation for paddy and preliminary watering for sowing of rabi.

Photo 22: Anicut

In most of the hilly tracts, small irrigation channels called 'kuls' are the only means of irrigation. These channels carry water diverted from streams by constructing temporary or pucca bunds across the streams. These channels are often constructed in hazardous hilly terrain under very difficult conditions. To avoid seepage of water and for the sake of stability, these channels are lined in most of the reaches.

Photo 23 : Surface Flow Scheme

Photo 24 : Surface Flow Scheme

(iii) Water conservation-cum-ground-water recharging Schemes:

Under this head are included schemes which serve primarily one or more of the following purposes:

- a. submerging agricultural land during monsoon for sowing post-monsoon crops,
- b. (ii) improving moisture regime of the adjoining fields downstream for raising of post-monsoon crops without irrigation and replenishing the ground water.

An additional advantage of these schemes is that they help to conserve the soil. When constructed in the head water region serving catchment area of tanks down below, they serve the important purpose of retarding the silting rate of these tanks.

The system of water conservation through field embankments is peculiar to central Indian tracts and is commonly in vogue in the northern Madhya Pradesh, Bundhelkhand region of Uttar Pradesh and eastern Rajasthan. In the Bundhelkhand region, these works are popularly known as 'bundhies', which consist of earthen embankments thrown across gently sloping ground. During the rainy season, water

is stored upstream and the land gets submerged. If the land slope is gradual, often large areas get submerged even by low embankments. Ordinarily, no direct irrigation is carried out and benefit is mostly due to submergence. In nearly all these areas, the soil is generally black which is retentive of moisture. After remaining submerged under water during the rainy season, the soil retains sufficient moisture to grow good rabi crops. The remaining water is let out and the submerged land released for cultivation. The other advantage of submerging land in this manner is that the first flood brings a lot of silt which acts as rich manure. By preventing free flow of water across steep gradient, the soil of the land is also conserved.

Ahars in Bihar, which store water for irrigation of paddy fields, also function somewhat in a similar manner. Water is let out in October for irrigating the rice fields and the drained out fields in the bed of the ahars are cultivated with rabi crops. The head water tanks popularly in vogue in Orissa have a similar role to perform. These consist of bunds put up across slope at the head of gullies with the objective of impounding and diverting the cumulative run-off into the wider valley area downstream of the bunds by percolation, seepage and surface flow. Surface channels are provided in the flanks to carry floodwater received in excess of the storage capacity of the bunds during the monsoon season.

Percolation tanks primarily constructed for the purpose of recharging ground water are in vogue in Maharashtra, Tamil Nadu,

Kerala and Rajasthan. Check-dams or rapats are in vogue in Rajasthan. They consist of bunds constructed across the streams for the purpose of retarding the surface flow and also the sub-surface flow to some extent by making the bed slope of the stream flattened. This results in increased percolation of water in the sub-soil with consequent increase of the ground water supply.

B. Surface Lift Irrigation Scheme:

In regions where the topography does not permit direct flow irrigation from rivers and streams, water has to be lifted into the irrigation channels. These works are similar to diversion schemes, but in addition pumps are installed and pump houses constructed. These schemes, being costly in operation, are feasible only in areas where

- a. gravity flow irrigation is not possible
- b. there is keen demand for irrigation and cultivators are enthusiastic,
- c. water is available in the streams for at least about 200 days in a year, and
- d. cheap electric power is available.

Installation of diesel operated pump sets for lifting water makes the operation and maintenance cost of these schemes

exorbitantly high. However, for lifting small order of discharge by individual cultivators, portable diesel engine pump sets are feasible as they provide greater flexibility and mobility for installation at different points of the water source or sources. In some areas Solar Pumps are also used for lifting water. The CCA of such schemes may go up to 20 hectares.
